**DIRECT TESTIMONY AND ATTACHMENTS OF GILBERT Y. FLORES**

1 I. **INTRODUCTION, QUALIFICATIONS, PURPOSE OF TESTIMONY, AND**  
2 **RECOMMENDATIONS**

3 Q. PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.

4 A. My name is Gilbert Y. Flores. My business address is 1800 Larimer Street,  
5 Denver, Colorado 80202.

6 Q. BY WHOM ARE YOU EMPLOYED AND IN WHAT POSITION?

7 A. I am employed by Xcel Energy Services Inc. (“XES”) as the Manager of  
8 Transmission Planning for Public Service Company of Colorado (“Public Service”  
9 or the “Company”). XES is a wholly owned subsidiary of Xcel Energy Inc. (“Xcel  
10 Energy”) and provides an array of support services to Public Service and the other  
11 utility operating company subsidiaries of Xcel Energy on a coordinated basis.

12 Q. ON WHOSE BEHALF ARE YOU TESTIFYING IN THE PROCEEDING?

13 A. I am testifying on behalf of Public Service.

1 **Q. PLEASE SUMMARIZE YOUR RESPONSIBILITIES AND QUALIFICATIONS.**

2 A. As the Manager of Transmission Planning for Public Service Company of  
3 Colorado, I am responsible for overseeing the engineering group responsible for  
4 planning Public Service's transmission system and also responsible for the  
5 development of Transmission budgets, regulatory compliance, and portions of the  
6 Operations & Maintenance ("O&M") associated with Public Service's transmission  
7 system. I also oversee various aspects of transmission policy and manage  
8 participation in key regional Public Service transmission projects, as well as other  
9 regional projects on and adjacent to Public Service's transmission system. This  
10 includes conducting strategic analyses for potential transmission projects,  
11 evaluating and negotiating joint agreements, and engaging in stakeholder  
12 outreach. A description of my qualifications, duties, and responsibilities is set forth  
13 in my Statement of Qualifications at the conclusion of my Direct Testimony.

14 **Q. WHAT IS THE PURPOSE OF YOUR DIRECT TESTIMONY?**

15 A. The purpose of my Direct Testimony is to support the Transmission Business Area  
16 (or "Transmission") capital additions and operation and maintenance ("O&M")  
17 expenses that are allocated to Public Service retail electric and included in the  
18 2023 test year ("Test Year") cost of service that is presented by Company witness  
19 Mr. Arthur P. Freitas. The Company's last electric rate case was Proceeding No.  
20 21AL-0317E (the "2021 Electric Phase I"), in which a test year ending December  
21 31, 2021 was approved as agreed to in a unanimous settlement. I therefore also  
22 provide support for Transmission's capital additions placed into service since the  
23 Company's 2021 Electric Phase I, from January 1, 2022 through year-end 2023.

1           The Company's Transmission plant additions since the 2021 Electric Phase  
2 I through December 31, 2023 total \$606.5 million. Company witness Mr. Mark P.  
3 Moeller has calculated the monthly plant balances to develop the plant-related roll  
4 forward, which is in turn used by Mr. Freitas to incorporate the 13-month average  
5 plant in service balances into the Test Year cost of service. These amounts do not  
6 include any plant additions associated with the Company's Wildfire Mitigation Plan  
7 ("WMP"), which is supported and discussed by Company witness Mr. Kristopher  
8 R. Farruggia.

9           I also support the \$28.3 million in Transmission's O&M included in the Test  
10 Year. Transmission's O&M in this rate case is based on actual O&M expenses for  
11 the 12 months ended June 30, 2022 with adjustments to set a level of O&M  
12 expenses that is representative of the level expected when rates are in effect.  
13 Company witnesses Mr. Steven P. Berman and Mr. Freitas support the Company's  
14 overall Test Year development.

15           I also describe Public Service's use of third-party wheeling service to  
16 transmit power to serve its customers, as well as the costs for these services, and  
17 I support the adjustments for Transmission Wheeling Services included in the Test  
18 Year.

19 **Q. ARE YOU SPONSORING ANY ATTACHMENTS AS PART OF YOUR DIRECT**  
20 **TESTIMONY?**

21 A. Yes, I am sponsoring Attachments GYF-1 through GYF-7, which were prepared  
22 by me or under my direct supervision. The attachments are as follows:

- 23 • Attachment GYF-1: Capital Additions for January 1, 2021 – December

1 31, 2023;

2 • Attachment GYF-2: July 1, 2021 through June 30, 2022 Transmission  
3 Operations and Maintenance Costs by Cost Element;

4 • Attachment GYF-3: July 1, 2021 through June 30, 2022 Transmission  
5 Operations and Maintenance Costs by FERC Account;

6 • Attachment GYF-4: Public Service Wheeling Transactions;

7 • Attachment GYF-5C: Confidential DCP High Point Project Costs;

8 • Attachment GYF-5: Public DCP High Point Project Costs;

9 • Attachment GYF-6: Greenwood to Denver Terminal (“GDT”) 230 kV  
10 Transmission Project and Uprate Project Costs; and

11 • Attachment GYF-7: Voltage Control Facilities Project Costs.

12 **Q. WHAT RECOMMENDATIONS ARE YOU MAKING IN YOUR DIRECT**  
13 **TESTIMONY?**

14 A. I recommend that the Colorado Public Utilities Commission (“Commission”)  
15 approve the Company’s 2022-2023 Transmission Business Area capital additions  
16 and the Transmission Business Area’s Test Year O&M expenses, as set forth in  
17 my Direct Testimony and in the cost of service presented by Mr. Freitas. Finally, I  
18 recommend the Commission include the Test Year adjustments for Transmission  
19 Wheeling Services in the Company’s cost of service.

1 **II. TRANSMISSION BUSINESS AREA OVERVIEW, FUNCTIONS, AND ACTIVITIES**

2 **Q. WHAT IS THE PURPOSE OF THIS SECTION OF YOUR DIRECT TESTIMONY?**

3 A. The purpose of this section of my Direct Testimony is to provide an overview of  
4 Public Service's Transmission Business Area functions and activities.

5 **Q. PLEASE PROVIDE AN OVERVIEW OF PUBLIC SERVICE'S TRANSMISSION**  
6 **SYSTEM.**

7 A. Public Service is a vertically integrated electric utility that owns and operates  
8 electric transmission facilities in Colorado. The Company uses its transmission  
9 system to deliver energy from our generating resources (both owned and  
10 purchased) to our wholesale and large retail customers, and to the Company's  
11 distribution facilities, which are used to provide service to most of our retail  
12 customers. Public Service's transmission system comprises approximately 4,985  
13 circuit miles of transmission lines. The transmission lines are rated at voltages  
14 between 44 kilovolt ("kV") and 345 kV. Public Service's transmission system  
15 includes many lines that are jointly-owned with neighboring systems, such as Tri-  
16 State Generation and Transmission Association, Inc. ("Tri-State") and the Western  
17 Area Power Administration ("WAPA"). The Company's 242 transmission and  
18 distribution substations are also used to deliver electric energy to customers.

19 **Q. PLEASE DESCRIBE THE TRANSMISSION BUSINESS AREA.**

20 A. The Transmission Business Area is responsible for the planning, construction,  
21 operation, and maintenance of the electric transmission facilities necessary to  
22 meet the current and future energy needs of our customers in a safe and reliable

1 manner. The Transmission Business Area is focused on ensuring that the  
2 Company's transmission facilities are reliable, resilient, and able to accommodate  
3 an increasingly diverse and dispersed number of electric generators.

4 **Q. PLEASE DESCRIBE THE DEPARTMENTS WITHIN THE COMPANY'S**  
5 **TRANSMISSION BUSINESS AREA AND THEIR KEY FUNCTIONS.**

6 A. There are six departments within the Company's Transmission Business Area.  
7 The key functions of these departments are as follows:

- 8 • *Asset management* is responsible for substation field engineering, which  
9 includes routine and emergency maintenance and operational activities  
10 for all Public Service substations. The organization also provides field  
11 implementation of certain North American Electric Reliability  
12 Corporation ("NERC") and Critical Infrastructure Protection ("CIP")  
13 compliance activities in addition to commissioning new substation  
14 facilities. Commissioning of new substation facilities involves ensuring  
15 that our substation facilities meet Federal Energy Regulatory  
16 Commission ("FERC"), NERC, and Company operational and reliability  
17 requirements. The Quality Assurance/Quality Control ("QA/QC")  
18 process performed by Company engineers and technicians tests the  
19 equipment and control systems of our electric substations prior to  
20 energizing. This department is also responsible for system  
21 sustainability. System sustainability provides, among other things,  
22 electric material and design standards for the design, construction, and  
23 maintenance of our Transmission assets by interpreting industry  
24 standards such as American National Standards Institute ("ANSI")  
25 standards. System sustainability is also responsible for developing  
26 Public Service's reliability-centered maintenance programs that ensure  
27 the health and reliability of existing assets. These processes establish  
28 the baseline performance expected by our operations and maintenance  
29 organizations and confirm the performance for compliance standards.

- 30 • *Transmission strategy and planning* is responsible for: (1) life cycle  
31 planning, transmission system planning, and associated capital  
32 budgeting; (2) negotiating transmission service-related contracts with  
33 generators, transmission owners, and distribution utilities; and (3)  
34 resolving wholesale customer transmissions service concerns. In  
35 addition, this department manages Xcel Energy's participation in key  
36 regional projects throughout its service territories, as well as other  
37 regional projects on and adjacent to the Company's transmission

- 1 systems, including the Public Service transmission system. This group  
2 is also responsible for the Company's policies and procedures in the  
3 competitive transmission acquisition processes.
- 4 • *Field operations* provides field services for construction, maintenance,  
5 and emergency repairs for transmission assets.
  - 6 • *Transmission portfolio delivery* is responsible for managing capital  
7 projects, programs, and portfolios, including designing and engineering  
8 transmission assets, managing third-party contractors, and securing and  
9 managing transmission land rights.
  - 10 • *System operations* is primarily responsible for the NERC Balancing  
11 Authority and Transmission Operations function for all Company  
12 transmission systems.
  - 13 • *Transmission business operations* directs the Transmission Business  
14 Area's efforts pertaining to compliance with NERC requirements and  
15 directs business performance achievement efforts.

1 **III. TRANSMISSION CAPITAL BUDGET, PROJECT SELECTION, AND FUNDING**

2 **Q. WHAT IS THE PURPOSE OF THIS SECTION OF YOUR DIRECT TESTIMONY?**

3 A. The purpose of this section of my Direct Testimony is to provide an overview of the  
4 Transmission Business Area's capital budgeting process, project development,  
5 and project management processes. I also explain how the Company keeps the  
6 Commission informed regarding its Transmission projects.

7 **Q. GENERALLY SPEAKING, WHAT TYPE OF CAPITAL INVESTMENTS ARE**  
8 **MADE BY THE TRANSMISSION BUSINESS AREA?**

9 A. Transmission's capital investments include transmission line components such as,  
10 poles, conductors, switches, and land rights for transmission line easements.  
11 Transmission also makes investments in substation components such as  
12 transformers, capacitor banks, reactors, circuit breakers, relay and communication  
13 equipment, remote terminals, and land rights for new substations. Transmission's  
14 capital projects generally fall into two major types. The first consists of large capital  
15 projects that are often multi-year projects. These projects are capital-intensive and  
16 are aimed at improving the transmission system, upgrading existing facilities to  
17 meet NERC compliance requirements and to accommodate new generation,  
18 replacing aging facilities, and making improvements to communication  
19 infrastructure and physical security.

20 In addition to these larger, multi-year capital projects, the Transmission  
21 Business Area also completes many smaller capital projects each year. These  
22 smaller projects comprise a majority of the total number of projects that

1 Transmission completes each year. Some examples of smaller projects include  
2 replacement of one to two structures or cross-arms due to age, condition, or storm  
3 damage.

4 **Q. HOW DOES TRANSMISSION CATEGORIZE ITS CAPITAL INVESTMENTS?**

5 A. Transmission's capital projects generally fall into six capital budget categories  
6 depending on the main purpose of the project. These capital budget categories  
7 are: (1) Asset Renewal; (2) Reliability Requirement; (3) Regional Expansion;  
8 (4) Interconnection; (5) Physical Security and Resiliency; and (6) Communication  
9 Infrastructure. I provide more detail on each of these categories below.

- 10 • *Asset Renewal:* This category is primarily for managing the health and  
11 performance of transmission assets. The main goal of the investments  
12 in this category is to ensure that critical assets including transmission  
13 lines, substations, and other related assets meet reliability and capacity  
14 requirements, while minimizing life-cycle costs. This includes planned  
15 replacement of aging transmission lines and substation equipment, and  
16 unplanned replacement of damaged lines or equipment. This category  
17 also includes investments in necessary tools to support capital projects  
18 and line relocations due to road projects.
- 19 • *Regional Expansion:* This category includes major high voltage  
20 transmission line projects that serve multiple needs including regional  
21 and local reliability and renewable energy development. Generally,  
22 these are multi-year initiatives and the types of projects for which the  
23 Company seeks a Certificate of Public Convenience and Necessity  
24 ("CPCN") from the Commission especially for projects with voltage  
25 ratings of 230 kV or greater.
- 26 • *Reliability Requirement:* Reliability projects are constructed to ensure  
27 that the transmission system is compliant with all NERC reliability  
28 standards. Compliance with NERC reliability standards is mandatory for  
29 all users, owners, and operators of the Bulk Electric System ("BES").  
30 FERC, NERC, and regional reliability entities monitor and enforce NERC  
31 compliance. The Transmission organization is continually studying the  
32 transmission system to assess compliance with NERC standards.  
33 These studies analyze the impacts of forecasted load growth, existing

1 and anticipated generation needs, and new generation interconnections  
2 to determine whether transmission upgrades are necessary.

- 3 • *Interconnection*: This category includes projects that the Company is  
4 required to construct under the FERC Open Access Transmission Tariff  
5 (“OATT”) to accommodate interconnection requests from generators,  
6 other transmission providers for their transmission lines, and new load.
  
- 7 • *Physical Security and Resiliency*: There are two critical aspects to this  
8 grouping of projects: physical security and grid resiliency. Physical  
9 security addresses physical threats to utility infrastructure, such as  
10 transmission lines and substation equipment. Grid resiliency addresses  
11 the Company’s ability to monitor and recover from incidents occurring  
12 on our system to limit disturbances that may leave our service territory  
13 exposed to prolonged outages, oftentimes by adding redundancy to our  
14 transmission system. This category also includes projects intended to  
15 address NERC standards related to security and grid resiliency.
  
- 16 • *Communication Infrastructure*: This category includes the fiber optic  
17 and communication network infrastructure buildout on the existing  
18 transmission system to improve communication connectivity for all  
19 business areas. This infrastructure allows the digital transfer of  
20 Supervisory Control and Data Acquisition (“SCADA”) data and tele-  
21 protection services. As telecommunication service providers are retiring  
22 the existing obsolete analog connections, Transmission will be  
23 continuing our efforts to privatize our communication network  
24 infrastructure across the Company’s service territory.

25 **Q. PLEASE DESCRIBE HOW PUBLIC SERVICE DEVELOPS ITS CAPITAL**  
26 **BUDGET FOR ITS TRANSMISSION BUSINESS AREA.**

27 A. The annual capital budget for Transmission is based on collaboration between  
28 corporate management of overall Company finances and the business needs that  
29 are identified by Transmission. Company witness Mr. Adam R. Dietenberger  
30 explains how the Company establishes overall business area capital spending  
31 guidelines and budgets based on financing availability, specific needs of business  
32 areas, and the overall needs of the Company. Mr. Dietenberger also explains that  
33 generally, there are more projects and work to be done than Xcel Energy has the

1 capacity to fund, resulting in the need for prioritization and assessment across  
2 business areas and operating companies that ultimately results in a capital budget  
3 specific to the Company and the Transmission Business Area.

4 **Q. PLEASE PROVIDE A SUMMARY OF TRANSMISSION'S CAPITAL**  
5 **BUDGETING PROCESS.**

6 A. Transmission employs a "bottom-up" budgeting process to identify the capital  
7 projects that we need to complete within a specific year for our business area. All  
8 of our capital projects are executed under the Capital Project Governance Process.  
9 This governance process has policies and procedures in place that enable  
10 Transmission to prioritize and balance our budget such that we appropriately  
11 allocate funds. Our capital budgeting process includes four main steps:

- 12 1. Identification of potential projects;
- 13 2. Vetting of potential projects;
- 14 3. Prioritization of potential projects; and
- 15 4. Rebalancing and reprioritization of projects based on corporate budget  
16 requirements.

17 **Q. PLEASE EXPLAIN HOW THE TRANSMISSION BUSINESS AREA RANKS AND**  
18 **FUNDS PROJECTS.**

19 A. The Transmission Business Area uses a multi-step project lifecycle process that  
20 takes a project from the identification of a need, through mitigation development,  
21 alternative evaluation, preliminary scope development, and cost estimating, before  
22 concluding with final scope approval.

1           The project originator develops a proposed statement of work for each  
2 project – typically consisting of the proposed scope, project description, necessity  
3 description, alternatives and proposed option, desired completion date,  
4 consequences of not pursuing the project, and a basic electric circuit diagram.

5           Multi-disciplinary project teams are established with members who have  
6 functional skills such as financial management, project management and controls,  
7 design and engineering, system operations, construction, siting and land rights,  
8 scheduling, and planning. Each project team is assembled to review the proposed  
9 scope and evaluate alternatives, and then to identify additional details for the  
10 preliminary scope and schedule, along with supporting documentation. The  
11 project team may prepare multiple higher-level estimates to assess alternative  
12 system solutions, and weigh proposed solutions against other alternatives. This  
13 determines the most reasonable electrical and financial solution that meets  
14 transmission needs as part of the overall planning process. The estimates for each  
15 proposed project may be included in the latter years of the Transmission Business  
16 Area's budget.

17           Once the conceptual electric solutions are identified, the Transmission  
18 Business Area reviews the capital projects to select those projects that best meet  
19 the system's reliability needs and contractual and regulatory obligations. The  
20 Transmission Business Area then assesses risks for the projects and captures  
21 project requirements, project scope, preliminary cost estimates, and required in-  
22 service date information.

1 All capital projects are then prioritized. Key drivers for risk prioritization  
2 strategy include reliability, regulatory compliance, contractual agreements, and  
3 economic, security, and other risk factors.

4 **Q. WHAT PROCESS DOES THE TRANSMISSION BUSINESS AREA FOLLOW TO**  
5 **MANAGE AND CONTAIN ITS CAPITAL COSTS?**

6 A. The Transmission Business Area reviews capital projects on a monthly basis after  
7 budget approval to compare the monthly budget to actual funds spent, and forecast  
8 at completion to total project budget. The Transmission Business Area performs  
9 a monthly project-forecasting exercise to ensure we have a steady and  
10 dependable flow of financial information regarding capital expenditures. Through  
11 this process, the entire Transmission Business Area project portfolio is reviewed  
12 and consolidated each month and any variances are addressed. All projects that  
13 indicate they may be outside of allowed variances are re-evaluated and assessed  
14 internally by the Transmission organization, and may be escalated for higher-level  
15 corporate review. For larger projects (*i.e.*, those greater than or equal to \$10  
16 million), we adhere to corporate governance to seek “re-approval” of projects  
17 outside the allowed variances.

18 Transmission also compares year-to-date actual performance with year-to-  
19 date and year-end forecasts. Transmission identifies deviations and  
20 recommendations to make sure financial targets are reviewed and approved. The  
21 Transmission Business Area is expected to manage its capital budget once that  
22 budget has been developed, vetted, and approved.

1 **Q. HOW IS THE COMMISSION INFORMED OF THE COMPANY'S**  
2 **TRANSMISSION PROJECTS?**

3 A. On an annual basis, Public Service provides the Commission with its Rule 3206  
4 Report, which identifies new construction or expansion of transmission facilities  
5 planned for the upcoming three calendar years. The report consists of five major  
6 sections: (1) new projects that may require a CPCN; (2) projects for which the  
7 Company requests a determination that no CPCN is necessary because the  
8 project is ordinary course of business; (3) status of projects previously reported;  
9 (4) projects generally considered conceptual at the time of filing which are being  
10 provided for informational purposes only; and (5) projects associated with the  
11 Colorado Energy Plan Portfolio ("CEPP") for which Public Service will file additional  
12 CPCN(s). The intent of Rule 3206 is to have utilities apprise the Commission of  
13 planned transmission projects and to allow the Commission to verify or determine  
14 which projects require or do not require a CPCN. Public Service submits its Rule  
15 3206 Report annually by April 30, and filed its most recent Rule 3206 Report in  
16 Proceeding No. 22M-0005E.<sup>1</sup>

17 Additionally, Rules 3625, 3626, and 3627 set forth requirements for  
18 transmission planning applicable to Commission-regulated utilities. These rules  
19 require these utilities to establish a process to coordinate the planning of additional  
20 electric transmission in Colorado in a comprehensive and transparent manner.

---

<sup>1</sup> The Commission noticed the Company's Rule 3206 Report filing on May 13, 2022 (mailed date) by Decision No. C22-0295-I, instructing interested parties to file comments on or before June 13, 2022. The Commission issued its Decision, Decision No. C22-0438, on the Company's Rule 3206 Report on August 2, 2022 (mailed date).

1 The process is to be conducted on a statewide basis and takes into account input  
2 received from interested stakeholders. The Commission's rules require periodic  
3 reporting to the Commission. Public Service and the other Commission-regulated  
4 utilities jointly submit a Rule 3627 10-Year Transmission Plan bi-annually on  
5 February 1 in even years, the most recent of which was filed in Proceeding No.  
6 22M-0016E. These Rule 3267 plans are the result of a cooperative effort between  
7 Black Hills Colorado Electric, LLC d/b/a Black Hills Energy, Tri-State, and Public  
8 Service.

9 The Commission is also informed of our transmission projects through the  
10 Company's annual Transmission Cost Adjustment ("TCA") filing in November, as  
11 well as individual CPCN filings made with the Commission as appropriate.

12 **Q. WHAT IS THE PURPOSE OF THE TCA?**

13 A. The TCA is the mechanism through which the Company recovers its transmission  
14 capital expenses. Each year, the Company requests recovery of its transmission  
15 capital expenses through its TCA filings, where the Commission has the  
16 opportunity to review the Company's forecasted transmission capital expenses.  
17 The Company's TCA was approved by Decision No. C07-1085 in Proceeding No.  
18 07A-339E, and the TCA tariff is set forth on Sheet Nos. 142-142C, COLO. PUC  
19 No. 8 - Electric. Among other things, the TCA tariff provides that "[w]henver the  
20 Company implements changes in base rates as the result of a final order in an  
21 electric Phase I rate case, it shall simultaneously adjust the TCA to remove all  
22 costs that have been included in base rates." Company witness Mr. Freitas

1 discusses the Company's proposed TCA roll-in to base rates in his Direct  
2 Testimony.

1                   **IV. TRANSMISSION 2022-2023 CAPITAL ADDITIONS**

2   **Q.    WHAT IS THE PURPOSE OF THIS SECTION OF YOUR DIRECT TESTIMONY?**

3   A.    The purpose of this section of my Direct Testimony is to support Transmission's  
4        capital additions from January 1, 2022 through December 31, 2023.<sup>2</sup> I begin with  
5        an overview and then provide details about specific capital projects, organized by  
6        Transmission's six capital budget categories: (1) Asset Renewal; (2) Regional  
7        Expansion; (3) Reliability Requirements; (4) Interconnection; (5) Physical Security  
8        and Resiliency; and (6) Communication Infrastructure.

9        **A. Overview of 2022-2023 Capital Additions**

10   **Q.    PLEASE SUMMARIZE TRANSMISSION'S 2022-2023 CAPITAL ADDITIONS.**

11   A.    Transmission's capital additions for 2022-2023 are summarized in Table GYF-D-  
12        1. I have also provided 2021 actual capital additions in this table for reference.

---

<sup>2</sup> Transmission's WMP capital additions are discussed by Company witness Mr. Farruggia.

1  
2  
3

**Table GYF-D-1**  
**Transmission Capital Additions**  
**Public Service Electric (Dollars in Millions)**

Budget Category	2021 (Actual)	2022			2023 (Forecast)
		1/1 – 6/30 (Actual)	7/1 – 12/31 (Forecast)	Total	
Asset Renewal	\$55.0	\$26.7	\$45.4	\$72.1	\$192.3
Regional Expansion	\$5.1	\$0.6	\$98.7	\$99.3	\$26.5
Reliability Requirements	\$26.7	\$26.1	\$28.4	\$54.6	\$48.5
Interconnection	\$7.6	\$41.2	\$7.6	\$48.8	\$9.9
Physical Security and Resiliency	\$6.9	\$2.0	\$16.6	\$18.6	\$9.5
Communication Infrastructure	\$0.9	\$0.0	\$6.2	\$6.3	\$20.2
<b>Total**</b>	<b>\$102.3</b>	<b>\$96.7</b>	<b>\$202.9</b>	<b>\$299.6</b>	<b>\$306.9</b>

\* This table does not include Transmission's WMP capital additions which are discussed separately by Company witness Mr. Farruggia.  
 \*\* There may be differences between the sum of the individual category amounts and Total amounts due to rounding.

4 More detail on the Transmission's capital additions for January 1, 2022 to  
 5 December 31, 2023 are included in Attachment GYF-1 (2021 - 2023 capital  
 6 additions).

7 **Q. PLEASE DESCRIBE THE DRIVERS OF TRANSMISSION'S CAPITAL**  
 8 **INVESTMENTS IN 2022 AND 2023.**

9 A. Transmission makes capital investments to maintain and improve the reliability of  
 10 the transmission system. An important part of maintaining the reliability of the  
 11 transmission system is replacing or refurbishing facilities that are in poor condition  
 12 or that have reached the end of their useful life. In 2022 and 2023, Transmission  
 13 will be making increased investments in Asset Renewal projects to address aging

1 transmission facilities that are in need of replacement or refurbishment. The  
2 assets that the Company plans to replace in 2022 and 2023 as part of our Asset  
3 Renewal programs have reached or exceeded their useful life. The physical  
4 deteriorations and declining electrical performances of these assets increase the  
5 likelihood of critical failures and sustained outages. Given the age, condition, and  
6 electrical performance of many of our transmission facilities, Public Service is  
7 making increasing investments in 2022 and 2023 to replace these facilities to  
8 ensure long-term system reliability. In 2022 and 2023, Transmission will also be  
9 making investments in several large Regional Expansion projects that are needed  
10 to provide greater system reliability and to provide the necessary transmission  
11 capacity to accommodate new generation sources. The Regional Expansion  
12 projects that the Company will be investing in during 2022 and 2023 include the  
13 Greenwood to Denver Terminal 230 kV Transmission Project and Uprate Projects  
14 (“GDT Project”) and the Canal Crossing – Goose Creek 345 kV transmission line  
15 project (part of the Company’s Power Pathway Project).

16 In 2022 and 2023, Transmission will also be completing a number of  
17 Reliability Requirement projects that are needed to ensure that the transmission  
18 system is in compliance with all NERC reliability standards.

19 Below I discuss the major Transmission projects Public Service has placed  
20 into service or will place into service in 2022 and 2023. Namely, below I identify  
21 and discuss the projects that comprise approximately 80 percent (or more) of  
22 Transmission’s total capital additions for each of the capital budget categories  
23 described above in 2022 and 2023.

1        **B.     Asset Renewal**

2        **Q.     PLEASE DISCUSS THE PRIMARY DRIVERS OF TRANSMISSION CAPITAL**  
3        **ADDITIONS RELATED TO ASSET RENEWAL IN 2022 AND 2023.**

4        A.     In 2022-2023, Transmission will be making increasing investments in Asset  
5        Renewal projects to address the condition of our transmission facilities. These  
6        investments include several major rebuild projects to replace aging transmission  
7        line facilities that are in poor condition. The total capital additions for Asset  
8        Renewal programs and projects for January 1, 2022 to December 31, 2023 total  
9        \$264.4 million.

10       **Q.     PLEASE PROVIDE AN OVERVIEW OF TRANSMISSION'S ASSET RENEWAL**  
11       **PROGRAMS.**

12       A.     Transmission's Asset Renewal programs are used to fund yearly replacement and  
13       refurbishment of key transmission facilities. Many of Transmission's Asset  
14       Renewal programs are focused on replacing equipment or facilities that have  
15       reached the end of their service life. These programs are referred to as End-of-  
16       Life or ELR programs. Transmission also has Asset Renewal programs that are  
17       focused on replacing assets that unexpectedly fail due to storms or other causes.  
18       The key Asset Renewal programs that have capital additions in 2022 and 2023  
19       are:

- 20       •     *Major Line Rebuild program:* This program is focused on rebuilding large  
21       segments of transmission line that have a concentrated number of defects  
22       that contribute to poor line performance. These projects are typically  
23       required either because the existing line circuits are at risk for increased  
24       outage frequency or because the number of structural defects on the circuit  
25       makes it unreasonable to refurbish only the defective portions. A rebuild  
26       project requires complete wreck out/removal of the physical line assets,

1 which are then replaced with new line assets (e.g., structures, conductor,  
2 and switches) either within the existing right-of-way or with minor, targeted  
3 right-of-way expansion to accommodate outage constraints and safe  
4 construction practices. The Company plans to place in service \$26.9 million  
5 in capital additions in 2022 and 2023 as part of the Major Line Rebuild  
6 program.

- 7
- 8 • *Storms and Emergency (“S&E”) Substation program:* This program  
9 replaces equipment that has failed due to a storm event or that is identified  
10 through a condition assessment as having a high probability of failure.  
11 Equipment that is replaced as part of this program includes the replacement  
12 of small substation assets such as reactors, relays, switches, and DC  
13 battery systems. An example of a project that will be completed as part of  
14 this program in 2022 and 2023 is the Ridge-9684 Replace Capacitor Bank  
15 project where the 115 kV reactor needs to be replaced at the Ridge  
16 Substation due to the condition of this asset. The Company plans to place  
17 in service \$17.2 million in capital additions in the S&E Substation program  
in 2022 and 2023.

- 18
- 19 • *Major Line Refurbishment program:* The Major Line Refurbishment program  
20 is a program to replace specific transmission line components, such as  
21 defective cross-arms, poles, and other structural components. This  
22 program differs from the Major Line Rebuild program in that the Major Line  
23 Rebuild program involves the complete removal and replacement of  
24 existing assets whereas the Major Line Refurbishment program addresses  
25 specific defects on an entire line segment (breaker to breaker), replacing all  
26 like property units on the line segment. By refurbishing specific components  
27 of a line segment, rather than rebuilding an entire line, the Company is able  
28 to increase circuit reliability and performance and extend the residual circuit  
29 life by between 10 to 20 years at a lower cost than a full line replacement.  
30 The Company plans to place in service \$13.3 million in capital additions as  
part of the Major Line Refurbishment program in 2022 and 2023.

- 31
- 32 • *Storms and Emergency (“S&E”) Line program:* S&E Line program includes  
33 projects associated with necessary replacement work in response to  
34 weather events, accidents, and other unscheduled maintenance work that  
35 if not completed puts the system at risk of failure. The work typically  
36 includes the replacement of cross-arms, poles, conductor, insulators, and  
37 other line appurtenances. The Company plans to place in service \$9.8  
38 million in capital additions as part of the S&E Line program in 2022 and  
2023.

- 39
- 40 • *End-of-Life Replacement (“ELR”) Breaker program:* Substation circuit  
41 breakers are devices used to protect the electrical system by interrupting  
short-circuit current that can be harmful to the station. These devices are

1 also used to open and close circuits. This program targets substation circuit  
2 breakers for replacement that have been identified due to poor performance  
3 or lack of available replacement parts for repair. The Company plans to  
4 place in service \$24.1 million in capital additions as part of the ELR Breaker  
5 program in 2022 and 2023.

- 6
- 7 • *ELR Relay program:* Protective relays monitor power system quantities,  
8 typically voltages and currents, and open and close circuits to remove short  
9 circuits from the power system. The ELR Relay program targets relays for  
10 replacement that exhibit poor performance and/or lack available  
11 replacement parts. The Company plans to place in service \$21.2 million in  
capital additions as part of the ELR Relay program in 2022 and 2023.

- 12
- 13 • *ELR Transformer program:* Substation transformers step voltage up or  
14 down. The ELR Transformer program targets substation transformers for  
15 replacement that have been identified due to poor performance or lack of  
16 available replacement parts for repair. The Company plans to place in  
17 service \$6.1 million in capital additions as part of the ELR Transformer  
program in 2022 and 2023.

18 **Q. PLEASE DESCRIBE THE DISCRETE ASSET RENEWAL PROJECTS THAT**  
19 **THE COMPANY PLANS TO PLACE IN SERVICE IN 2022 AND 2023.**

20 A. In addition to the Asset Renewal programs I discussed, Transmission also plans  
21 to complete several discrete Asset Renewal projects in 2022 and 2023. These  
22 discrete Asset Renewal projects are needed to replace transmission facilities that  
23 are near the end of their useful life. The major discrete Asset Renewal projects  
24 that the Company plans to complete in 2022 and 2023 include:

- 25
- 26 • *9811 Major Line Rebuild:* This project involves rebuilding 73 miles of 115  
27 kV transmission line on Circuit 9811 from the Poncha Junction  
28 Substation to the Sargent Substation then on to San Luis Valley  
29 Substation with new steel structures, conductor, and optical ground wire  
30 (OPGW). The existing circuit primarily consists of wood structures  
31 installed around 1956 that has more than 1,400 defective components.  
32 Therefore, this project aims to improve system reliability by completely  
33 replacing this deteriorated circuit. This is a multi-year project with  
34 construction spanning from 2022 through 2024. Capital additions in  
2022 and 2023 for this project are forecasted to be \$42.8 million.

- 1
- 2
- 3
- 4
- 5
- 6
- 7
- 8
- *9256 Major Line Rebuild:* This project involves rebuilding 11 miles of 115 kV transmission line on Circuit 9256 from the Hopkins Substation to the Basalt Substation with new steel structures, conductor, and OPGW. The existing circuit primarily consists of steel structures installed around 1908 that has more than 80 defective components. This project aims to improve system reliability by completely replacing this deteriorated circuit. Capital additions in 2022 and 2023 for this project are forecasted to be \$16.9 million.
- 9
- 10
- 11
- 12
- 13
- 14
- 15
- 16
- *9254 Major Line Rebuild:* This project involves rebuilding 13 miles of 115 kV transmission line on Circuit 9254 from the Leadville Substation to the Climax Substation with new steel structures, conductor, and OPGW. The existing circuit primarily consists of wood structures installed around 1930 and has more than 110 defective components. This project aims to improve system reliability by completely replacing this deteriorated circuit. Capital additions in 2022 and 2023 for this project are forecasted to be \$16.8 million.
- 17
- 18
- 19
- 20
- 21
- 22
- 23
- 24
- *9255 Major Line Rebuild:* This project involves rebuilding 20 miles of 115 kV transmission line on Circuit 9255 from Malta to Otero Tap Substations in San Luis Valley with new steel structures, conductor, and OPGW. The existing circuit primarily consists of wood structures installed around 1950 and has more than 360 defective components. This project aims to improve system reliability by completely replacing this deteriorated circuit. Capital additions in 2022 and 2023 for this project are forecasted to be \$16.0 million.

25 **C. Regional Expansion**

26 **Q. PLEASE DISCUSS THE KEY REGIONAL EXPANSION PROJECTS IN 2022**  
27 **AND 2023.**

28 A. There are three key Regional Expansion projects that have capital additions in  
29 2022-2023: (1) Voltage Control Facilities Project; (2) the Greenwood to Denver  
30 Terminal 230 kV Transmission Project and Uprate Projects (“GDT Project”); and  
31 (3) Canal Crossing – Goose Creek 345 kV Transmission Project (part of Colorado  
32 Power Pathway).

1 **Q. PLEASE DESCRIBE THE VOLTAGE CONTROL FACILITIES PROJECT.**

2 A. The Voltage Control Facilities Project is needed to implement the CEPP by  
3 accommodating the early retirement of Comanche 1 and 2 and safely and reliably  
4 integrating the wind and solar generating facilities. The Voltage Control Facilities  
5 Project includes installing voltage support devices, capacitors, and reactors at  
6 several different substations.

7 The Company applied for a CPCN for the Voltage Control Facilities Project  
8 in Proceeding No. 19A-0728E. This CPCN proceeding was combined with the  
9 Company's CPCN proceeding for its GDT Project. The Commission granted  
10 CPCNs for both projects in September 2020 in Decision No. C20-0648.

11 In 2022 and 2023, the Company will continue to develop the STATCOM  
12 flicker control project located at the CF&I Furnace Substation if it is needed. The  
13 Company is currently studying the system to determine if this flicker mitigation  
14 project is still warranted. The Voltage Control Facilities project is forecasted to  
15 have \$0.4 million in capital additions in 2022 and 2023 related to the final  
16 integration of the other voltage control projects located at the Missile Site, Daniels  
17 Park, and Pronghorn substations.

18 **Q. PLEASE DESCRIBE THE GDT PROJECT.**

19 A. The GDT Project is needed to implement the CEPP approved by the Commission  
20 in Decision No. C18-0761 in Proceeding No. 16A-0396E (i.e., the Company's 2016  
21 Electric Resource Plan ("ERP") proceeding). The GDT Project involves: (1)  
22 installing approximately 15 miles of new 230 kV transmission facilities located in  
23 existing rights-of-way originating at the existing Greenwood Substation, located in

1 the southeastern Denver Metro area, and terminating at the Denver Terminal  
2 Substation located on the west side of the City of Denver's city center; and (2)  
3 modifications to the existing Greenwood, Arapahoe, and Denver Terminal  
4 substations to accommodate the new 230 kV circuit, including an expansion of the  
5 Denver Terminal Substation.

6 In February 2020, the Company applied for a CPCN for the GDT Project in  
7 Proceeding No. 20A-0063E. This CPCN proceeding was combined with the  
8 Company's CPCN proceeding for its Voltage Control Facilities Project. The  
9 Commission granted CPCNs for both projects in September 2020 in Decision No.  
10 C20-0648.

11 Construction of the transmission line uprate projects were completed in  
12 2020 and modifications of facilities for the transmission line were completed in  
13 June 2021. The remaining 230 kV transmission line construction and substation  
14 installations and modifications are scheduled to be completed in December 2022.  
15 The GDT Project is forecasted to have \$73.6 million in capital additions in 2022.

16 **Q. DID THE COMMISSION'S CPCN DECISION INCLUDE ANY SPECIAL**  
17 **CONDITIONS RELATED TO THE VOLTAGE CONTROL FACILITIES PROJECT**  
18 **AND THE GDT PROJECT?**

19 **A.** Yes. The Commission's decision approving CPCNs for the Voltage Control  
20 Facilities Project and the GDT Project, requires that "Public Service in its next base  
21 rate case filing following the date that all facilities associated with the Voltage  
22 Control and GDT CPCNs are in service, to specifically identify the actual costs for  
23 the Voltage Control and GDT projects, individually and in total, in at least as much

1 detail as provided in this proceeding.”<sup>3</sup> While not all of the facilities associated with  
2 the Voltage Control Facilities and GDT projects will be in service prior to the filing  
3 of this rate case, the Company is requesting recovery of the costs of these projects  
4 in this rate case. As such, the Company is providing the project costs for these  
5 two projects at the same level of detail as was presented in the CPCN proceedings.  
6 Attachment GYF-7 provides the detailed project costs for the Voltage Control  
7 Facilities Project and Attachment GYF-6 provides the detailed project costs for the  
8 GDT Project. I note that since the costs in the CPCN proceeding were provided in  
9 capital expenditures, the costs presented in Attachment GYF-6 and GYF-7 are  
10 also in capital expenditures.

11 **Q. HOW DOES THE CURRENT COST ESTIMATE FOR THE VOLTAGE CONTROL**  
12 **FACILITIES PROJECT COMPARE TO THE COST ESTIMATE PROVIDED IN**  
13 **THE CPCN PROCEEDING?**

14 A. The current forecasted Estimated at Completion (“EAC”) cost for the Voltage  
15 Control Facilities Project is \$79.9 million, which is \$13.7 million lower than the  
16 \$93.6 million estimate provided in the Voltage Control Facilities CPCN proceeding.

17 **Q. HOW DOES THE CURRENT COST ESTIMATE FOR THE GDT PROJECT**  
18 **COMPARE TO THE COST ESTIMATE PROVIDED IN THE CPCN**  
19 **PROCEEDING?**

20 A. The current forecasted EAC cost for the GDT Project is \$99.5 million, or \$47.6  
21 million higher than the \$51.9 million estimate provided in the CPCN proceeding.

---

<sup>3</sup> Decision No. C20-0648 at 31.

1 The Company discussed the reasons for this cost increase in its August 1, 2022  
2 Semi-Annual Progress Report #4 to the Commission. As discussed in this report,  
3 the Company explained that the additional costs are largely driven by increased  
4 engineering and construction costs associated with construction of a portion of the  
5 project that crosses and/or parallels BNSF Railway railroad infrastructure. In  
6 particular, the Company had to modify its construction methods, design, and scope  
7 for the portion of this portion of the project to meet BNSF's federally mandated  
8 safety and security requirements and design specifications. The costs of the GDT  
9 Project also increased due to the need for an expanded scope of work at the  
10 Denver Terminal Substation and Arapahoe Substation due to unforeseen  
11 challenges with locating underground obstructions. Additional construction work  
12 was required to properly locate underground facilities in these existing substations,  
13 which resulted in the need to redesign and engineer the necessary substation  
14 modifications. The GDT Project has also experienced general cost increases due  
15 to increases in material commodity prices, transportation and fuel costs, and labor  
16 costs. With regard to material costs, the Company has experienced increased  
17 costs for transformer steel, copper, and oil and increased steel costs for  
18 transmission line structures. During construction of the project, the Company has  
19 also experienced increased transportation and fuel costs as well as labor cost  
20 increases due to a shortage of trained workers.

1 **Q. PLEASE DESCRIBE THE CANAL CROSSING – GOOSE CREEK 345 KV**  
2 **TRANSMISSION LINE PROJECT.**

3 A. The Canal Crossing – Goose Creek 345 kV transmission line project is part of  
4 Public Service’s Power Pathway Project. The Pathway Project is a series of 345  
5 kV transmission lines totaling approximately 560 miles that will connect the Front  
6 Range to areas rich in solar and wind potential in northeastern, eastern, and  
7 southeastern Colorado. Public Service applied for a CPCN for the Power Pathway  
8 Project in March 2021 and the Commission granted the requested CPCN in June  
9 2022 (mailed date) in Decision No. C22-0270.

10 The Canal Crossing – Goose Creek 345 kV transmission line project  
11 involves building a new 345 kV breaker and a half station configuration at Canal  
12 Crossing Switching Station plus the 345 kV breaker and a half station configuration  
13 at Goose Creek Switching Station and then connecting them by constructing 146  
14 miles of double circuit 345 kV transmission line. In 2022 and 2023, the Company  
15 will be acquiring right-of-way, acquiring land, and performing detailed design,  
16 ordering materials, and beginning construction of this project. The Company plans  
17 to place in service \$23.0 million in capital additions for right-of-way and land  
18 acquisition on the Canal Crossing – Goose Creek 345 kV transmission line project  
19 in 2022 and 2023.

1           **D.     Reliability Requirements**

2           **Q.     WHAT ARE THE DRIVERS OF THE COMPANY'S INVESTMENTS IN**  
3           **RELIABILITY REQUIREMENT PROJECTS?**

4           A.     NERC develops and enforces reliability standards on all transmission owners,  
5           operators, and users. The Company performs transmission planning studies to  
6           identify necessary upgrades to the system to ensure compliance with NERC  
7           reliability standards. Through these studies, transmission planners evaluate  
8           different alternatives to meet the identified electrical needs of the system and  
9           select the best option to meet the identified need. Total capital additions for  
10          Reliability Requirements projects in 2022 and 2023 total \$103.1 million.

11          **Q.     WHAT ARE THE KEY RELIABILITY REQUIREMENTS PROJECTS IN 2022**  
12          **AND 2023?**

13          A.     The key Reliability Requirement projects in 2022 and 2023 include:

- 14                   •     *Greeley Area Upgrades North project:* The Weld County and Greeley  
15                   area have been experiencing various system reliability issues including  
16                   system outages and increasing system component failures. This project  
17                   involves replacing the 44 kV system with a modern 115 kV and 230 kV  
18                   infrastructure. Substation scope includes installing a 230/115/44/13 kV  
19                   Husky transmission Substation, a 115/13 kV Collins Street distribution  
20                   Substation, expanding the Cloverly Switchyard to a 115/13 kV  
21                   distribution Substation with ring-bus, and add a 230 kV Terminal at  
22                   WAPA's Ault Substation. This project also includes installing 21.5 miles  
23                   of new transmission line including 4.8 miles of new single circuit 230 kV  
24                   line from WAPA's Ault to Husky Substation, 14.7 miles of new single  
25                   circuit 115 kV line from Husky to Cloverly Substation, 2.0 miles of single  
26                   circuit 44 kV line from Husky to Continental Substation, plus removal of  
27                   the 44 kV transmission and distribution system north of Greeley. Capital  
28                   additions in 2022 and 2023 are forecasted to be \$28.2 million.
  
- 29                   •     *Pawnee – Daniels Park Reconductor project:* This is a multi-year project  
30                   that involves rebuilding/reconductoring of approximately 66 miles of  
31                   transmission line on Circuit 5457 (Pawnee-Missile Site) and Circuit 5113

1 (Missile Site-Daniels Park), which are single circuit 230 kV lines. The  
2 final phase of this project (Phase 4) that will be completed in 2022 is to  
3 reconductor the 12.5 miles of pipet conductor with grosbeak conductor  
4 from Missile Site to Byers. Capital additions in 2022 and 2023 for this  
5 project are forecasted to be \$13.8 million.

- 6
- 7 • *DCP Timnath project:* This project is needed to provide additional  
8 capacity to serve new load growth in this fast-growing area of northern  
9 Colorado and to provide back-up service to the Cobb Lake and Windsor  
10 substations. The Timnath project is a joint project between Transmission  
11 and Distribution. The Transmission portion of the project includes  
12 construction of a three-mile long double-circuit 230 kV transmission line  
13 to connect the Company's new Avery Substation in the Town of Windsor  
14 to the existing Ault – Timberline 230 kV transmission line. The  
15 Transmission capital additions in 2022 and 2023 for this project are  
16 forecasted to be \$13.5 million. Company witness Mr. David C. Mino  
discusses the Distribution portion of this project.

- 17
- 18 • *DCP High Point project:* This project is needed to accommodate several  
19 large residential and commercial developments being planned between  
20 Pena Boulevard and Powhaton Road in the City of Aurora, south of  
21 Denver International Airport. The DCP High Point project is a joint  
22 project between Transmission and Distribution. The project includes  
23 construction of a new 230/13.8 kV, 50 MVA High Point Substation,  
24 distribution feeders, and construction of approximately 3.5 miles of new  
25 230 kV double-circuit transmission line that will tap into the Company's  
26 existing 5277 Spruce-Green Valley 230 kV transmission line. The  
27 Company filed a CPCN application for the High Point Project on March  
28 2, 2020 in Proceeding No. 20A-0082E (the "High Point CPCN  
29 Proceeding") and the CPCN was granted on October 12, 2020 by  
30 Decision No. R20-0725 (exceptions denied in Decision No. C20-0886).  
31 The Transmission portion of the High Point project has \$12.9 million in  
32 forecasted plant additions in 2022 and 2023. Company witness Mr.  
33 Mino also discusses the Distribution portion of this project in his Direct  
Testimony.

- 34
- 35 • *Spill Prevention Control and Countermeasure (SPCC) Improvements:*  
36 This program updates secondary containment at existing Public Service  
37 substations to comply with federal environmental law and Xcel  
38 environmental policy requirements. Secondary containment is a control  
39 measure placed or built around a transformer to prevent its oil from  
40 flowing into the drainage system during a spill or discharge. Capital  
41 additions in 2022 and 2023 for this program are forecasted to be \$10.7  
million.

1  
2 **Q. AS PART OF THE HIGH POINT CPCN PROCEEDING, DID THE COMMISSION**  
3 **REQUEST THAT THE COMPANY PROVIDE SPECIFIC INFORMATION TO**  
4 **SUPPORT COST RECOVERY FOR THIS PROJECT?**

5 A. Yes, the Commission’s CPCN Decision in the High Point CPCN Proceeding (“High  
6 Point CPCN Decision”) directed that in the next base rate case filing following the  
7 date that all facilities associated with the High Point project are in service that  
8 Public Service “specifically identify the actual costs for the Project, individually and  
9 in total, in at least as much detail as provided in this proceeding.”<sup>4</sup> While all of the  
10 components of the DCP High Point project will not be placed in service until May  
11 2023, the Company is requesting recovery of the costs for the High Point project  
12 in this proceeding. Attachment GYF-5C provides a detailed cost estimate for the  
13 High Point project and compares the EAC cost with the costs presented in the High  
14 Point CPCN Proceeding. I note that since the costs in the High Point CPCN  
15 Proceeding were provided in capital expenditures, the costs in Attachment GYC-  
16 5C are also presented in capital expenditures rather than capital additions.

17 **Q. HOW DOES THE CURRENT COST ESTIMATE FOR THE DCP HIGH POINT**  
18 **PROJECT COMPARE TO THE COST ESTIMATE PROVIDED IN THE HIGH**  
19 **POINT CPCN PROCEEDING?**

20 A. In the High Point CPCN Proceeding, Public Service provided a cost estimate of  
21 \$10.7 million (capital expenditures) for the Transmission portion of the DCP High  
22 Point project. The Company’s current cost estimate for the Transmission portion

---

<sup>4</sup> Proceeding No. 20A-0082E, Decision No. R20-0725, ¶ 71 (mailed Oct. 12, 2020).

1 of the DCP High Point Project is \$15.1 million (capital expenditures). In the High  
2 Point CPCN Proceeding, Public Service also provided a cost estimate of \$17.6  
3 million (capital expenditures) for the Distribution portion of the DCP High Point  
4 project. The Company's current cost estimate for the Distribution portion of the  
5 DCP High Point Project is \$22.5 million (capital expenditures).

6 **Q. PLEASE EXPLAIN WHY THE CURRENT FORECASTED CAPITAL**  
7 **EXPENDITURES FOR THE DCP HIGH POINT PROJECT ARE HIGHER THAN**  
8 **THE AMOUNT ESTIMATED IN THE HIGH POINT CPCN PROCEEDING.**

9 A. There are several reasons why the current costs are higher: (1) higher steel  
10 commodity prices; (2) general supply chain and inflationary pressures; and (3)  
11 substantive scope/design changes that I will address later in my testimony. Steel  
12 prices increased rapidly following the onset of the COVID-19 pandemic and have  
13 generally remained well above pre-pandemic levels (which were the basis of the  
14 cost estimates in the High Point CPCN Proceeding, with a decision reached in  
15 October 2020). As steel is needed for the infrastructure at the High Point  
16 Substation, the increase in steel prices have resulted in higher material risk  
17 reserves and escalation of the expected cost of the project. Second, like many  
18 aspects of the Company's business (and the economy overall) as described by  
19 Company witness Mr. Sangram Bhosale, supply chain challenges and inflation  
20 throughout the economy have increased material costs from what was assumed  
21 in the High Point CPCN Proceeding. For example, the anticipated capital additions  
22 for the substation transformer and switchgear is approximately \$12.3 million in  
23 2023. In 2021, the Company's budget estimates for these pieces of equipment

1 was \$10.1 million. Inflationary pressures have been driving up the costs for all  
2 facets of the project.

3 **Q. PLEASE EXPLAIN HOW SCOPE/DESIGN CHANGES FOR THE DCP HIGH**  
4 **POINT PROJECT HAVE IMPACTED THE TRANSMISSION COSTS FOR THIS**  
5 **RPROJECT?**

6 A. The final permitted location for the substation shifted due to landowner opposition  
7 and required two additional transmission lines to connect into the existing system.  
8 The proximity of these lines to the Denver International Airport necessitated use of  
9 special reduced-height structures. The additional lines and the associated  
10 materials, engineering, construction and overhead costs contributed a \$2.5 million  
11 increase to the Transmission costs for the project. Furthermore, the additional line  
12 length carried with it an increase in land and right-of-way costs of \$1.5 million.

13 **Q. PLEASE EXPLAIN WHY THE CURRENT FORECASTED DISTRIBUTION**  
14 **CAPITAL EXPENDITURES FOR THE DCP HIGH POINT PROJECT ARE**  
15 **HIGHER THAN THE COSTS ESTIMATED IN THE CPCN PROCEEDING.**

16 A. Distribution cost increases were also driven by two main factors. First, the  
17 permitted substation location added site specific requirements of a longer access  
18 drive at a cost increase of \$0.8 million, additional grading and detention pond that  
19 increased the cost of the project by \$2.0 million, and added screening  
20 requirements adding \$0.6 million more in wall cost. Second, post-pandemic  
21 inflationary cost pressures on construction labor, materials, commodities, and  
22 associated overheads added another \$1.5 million to the substation costs.

1           **E.    Interconnection**

2   **Q.    WHAT ARE THE DRIVERS OF TRANSMISSION’S INTERCONNECTION**  
3   **INVESTMENTS?**

4   A.    Transmission is required to make necessary upgrades to accommodate  
5   interconnection requests.  There are three general types of Interconnection  
6   projects that drive our interconnection investments: generation interconnections,  
7   transmission interconnections, and load interconnections.  Generation  
8   interconnections are where a new generator requests to interconnect to our  
9   transmission system.  Transmission interconnections are where one utility  
10   requests to interconnect a transmission line to our transmission system.  Load  
11   interconnections are where a new substation serving electric load is needed and  
12   requests to interconnect to our transmission system or an existing load serving  
13   substation is being modified.

14   **Q.    WHAT ARE THE KEY INTERCONNECTION PROJECTS IN 2022 AND 2023?**

15   A.    The key Interconnection projects in 2022 and 2023 include:

- 16           •    *GI-2018-24 Neptune:* The Tundra Switching Station is located 20 miles  
17           from the existing Comanche Substation in Pueblo County and was  
18           constructed to accommodate the new “Neptune” 250 MW Hybrid  
19           Generating Facility (250 MW solar plus 125 MW Battery Energy  
20           Storage) approved as part of the CEPP.  The initial design of the Tundra  
21           Substation includes tapping the Comanche – Daniels Park 345 kV line.  
22           The Tundra Switching Station consists of a three-breaker ring  
23           configuration.  This project is budgeted to have \$22.1 million in capital  
24           additions in 2022 and 2023.

- 25           •    *GI-2018-25 Thunderwolf:* The Mirasol Switching Station is located 12  
26           miles east of the existing Comanche Substation in Pueblo County was  
27           constructed to accommodate the new “Thunderwolf” 200 MW Hybrid  
28           Generating Facility (200 MW solar plus 100 MW Battery Energy  
29           Storage) approved as part of the CEPP.  The initial design of the Mirasol

1 Substation includes tapping the Comanche – Midway 230 kV line. This  
2 project is budgeted to have \$19.9 million in capital additions in 2022  
3 and 2023.

- 4 • *GI-2015-16 Arriba*: The scope of this project is to satisfy generation  
5 interconnection request “GI-2015-16 Arriba” to connect a new 200 MW  
6 wind generation facility at the Shortgrass Switching Station by installing  
7 a line termination and a 30 MVAR reactor at the existing Shortgrass  
8 Switching Station. This project is budgeted to have \$10.4 million in  
9 capital additions in 2022 and 2023.

10 **F. Physical Security and Resiliency**

11 **Q. PLEASE DISCUSS THE PRIMARY DRIVERS OF TRANSMISSION CAPITAL**  
12 **ADDITIONS RELATED TO PHYSICAL SECURITY AND RESILIENCY IN 2022**  
13 **AND 2023.**

14 A. Transmission is focused on maintaining the physical security of our assets. High  
15 voltage transformers make up less than three percent of transformers in U.S.  
16 electric power substations, but they carry 60 to 70 percent of the nation’s electricity.  
17 Because they serve as vital nodes and carry bulk volumes of electricity, these  
18 transformers are critical elements of the nation’s electric power grid. They are also  
19 the most vulnerable to intentional damage from malicious acts. In April 2013, a  
20 substation in California was subject to a coordinated military-type sniper attack that  
21 disabled high voltage transformers and rendered this substation useless. Federal  
22 regulatory agencies have responded to these growing threats by adopting physical  
23 security standards for transmission facilities. On March 7, 2014, FERC issued an  
24 Order on Reliability Standards for Physical Security Measures, resulting in NERC  
25 standard CIP-014 addressing risks due to physical security threats and  
26 vulnerabilities. To address these threats and meet these new NERC standards,

1 Public Service is making necessary investments to make our grid more resilient so  
2 that the Company can respond quickly to physical security threats. Total capital  
3 additions for Physical Security and Resiliency projects in 2022 and 2023 are  
4 forecasted to be \$28.1 million.

5 **Q. WHAT ARE THE KEY PHYSICAL SECURITY AND RESILIENCY PROJECTS**  
6 **THAT TRANSMISSION PLANS TO PLACE SERVICE IN 2022 AND 2023?**

7 A. The majority of the Physical Security and Resiliency projects that are planned to  
8 be placed in-service in 2022 and 2023 will be part of the two programs: (1)  
9 Operational Technology (“OT”) Cyber Security program and (2) Physical Security  
10 program.

11 **Q. WHAT IS THE OT CYBER SECURITY PROGRAM?**

12 A. The OT Cyber Security program involves upgrades to the Company’s transmission  
13 infrastructure to meet NERC CIP-1047 requirements. These upgrades include  
14 security monitoring and logging, vulnerability and patch management, and  
15 information management/password management and asset management. The  
16 Company anticipates placing in service \$14.3 million in capital additions as part of  
17 this program in 2022 and 2023.

18 **Q. PLEASE DESCRIBE THE PHYSICAL SECURITY PROGRAM.**

19 A. The purpose of this program is to improve the physical security of the Company’s  
20 substations and to ensure compliance with NERC CIP-014. The Company plans  
21 to place in service \$13.7 million in capital additions as part of this program in 2022  
22 and 2023. An example of a project that the Company plans to complete during  
23 this period involves physical infrastructure upgrades at the Denver Terminal

1 Substation. These upgrades include upgrading the substation fence, replacing  
2 existing lighting, gate replacements, and other security related improvements.

3 **G. Communication Infrastructure**

4 **Q. WHAT ARE THE KEY COMMUNICATION INFRASTRUCTURE PROJECTS IN**  
5 **2022 AND 2023?**

6 A. The Communication Infrastructure projects that the Company plans to in service  
7 in 2022 and 2023 will be part of the Communication Network program.

8 **Q. DESCRIBE THE COMMUNICATION NETWORK PROGRAM.**

9 A. The Communication Network program aims to privatize Xcel Energy's  
10 communication network infrastructure across the Public Service territory, wherever  
11 possible, at all transmission and distribution substations for SCADA, tele-  
12 protection, and remote engineering access. Specifically, the program addresses  
13 aging analog circuit technology and other technology that is anticipated to become  
14 obsolete within five years. The Company will then build secure communication  
15 architecture for physically isolated operational technology (OT) and information  
16 technology (IT) networks from each other to support islanding of the energy  
17 management system (EMS) for further cyber security resilience. The program will  
18 enable the Company to reduce dependency on third-party circuit providers, which  
19 will improve the Company's troubleshooting response time and reduce circuit down  
20 time. The Company has budgeted \$25.5 million for the Communication Network  
21 program in 2022 and 2023.

1 **Q. PLEASE PROVIDE AN EXAMPLE OF A COMMUNICATION NETWORK**  
2 **PROGRAM PROJECT THAT IS PLANNED TO BE COMPLETED IN 2022 OR**  
3 **2023.**

4 A. One example is the replacement of the overhead shield wire between the Vasquez  
5 and Fort Lupton substations with OPGW. To accommodate this replacement, 14  
6 transmission structures will be replaced plus structure modifications and defect  
7 corrections will be completed. In addition, the Company will be working to  
8 accommodate fiber connections inside the electrical equipment enclosures at the  
9 substations.

1 **V. TRANSMISSION O&M EXPENSES**

2 **Q. WHAT IS THE PURPOSE OF THIS SECTION OF YOUR DIRECT TESTIMONY?**

3 A. The purpose of this section of my Direct Testimony is to support the Company's  
4 non-WMP Transmission O&M expenses through June 30, 2022, as adjusted for:  
5 (1) items discussed below; and (2) labor and non-labor costs as discussed and  
6 quantified by Company witnesses Mr. Michael P. Deselich and Mr. Freitas, as the  
7 appropriate level of non-WMP Transmission O&M expense in the Test Year.<sup>5</sup>

8 **Q. FOR BACKGROUND, DOES THE COMPANY RECOVER TRANSMISSION**  
9 **O&M EXPENSES THROUGH THE TCA?**

10 A. No. The TCA is only used for recovery of capital expenses for Transmission  
11 projects. Transmission O&M expenses are recovered through base rates.

12 **Q. WHAT ARE THE TYPES OF COSTS THAT THE TRANSMISSION BUSINESS**  
13 **AREA INCURS FOR O&M?**

14 A. I describe above the various work that is performed by the Transmission Business  
15 Area. To perform this work, the Transmission Business Area generally incurs O&M  
16 expenses each year in the following six categories:

- 17 • *Internal Labor:* Costs related to the O&M portion of salaries, straight  
18 time labor, overtime, premium time, and employee expenses for internal  
19 employees.
- 20 • *Contract Labor and Consulting:* Costs related to the use of contract  
21 labor and consultants, which allows Public Service to increase and  
22 decrease staffing levels as workloads require rather than adding more  
23 full-time staff, and to retain the services of experts as needed for specific  
24 tasks or project efforts.

---

<sup>5</sup> Transmission's WMP O&M is discussed by Mr. Farruggia.

- 1 • *Fees:* Fees the Company is required to pay include regulatory fees,  
2 license fees and permits related to railroads and land, environmental  
3 fees, and professional association dues that are necessary for the  
4 operation of our business.
  
- 5 • *Materials:* Costs related to consumables, hardware, and refurbished  
6 materials used in substation maintenance and repair operations, as well  
7 as tools, small equipment, and supporting supplies.
  
- 8 • *Fleet:* Costs for the internal fleet assets as directed to O&M accounts  
9 on an hourly basis including cars, trucks, construction equipment, and  
10 trailers.
  
- 11 • *Other:* Includes miscellaneous other costs such as use costs,  
12 maintenance costs, employee expenses, rents, network communication  
13 costs and office supplies.

14 **Q. WHAT WERE TRANSMISSION'S ACTUAL O&M COSTS FOR THE 12-MONTH**  
15 **PERIOD ENDING JUNE 30, 2022?**

16 A. Transmission's actual O&M expenses for the 12-month period ended June 30,  
17 2022 totaled \$28.0 million. Table GYF-D-2 below breaks down these actual O&M  
18 costs by the cost categories I discussed above. Attachments GYF-2 and GYF-3  
19 provide an accounting of these O&M expenses by Cost Element and FERC  
20 account, respectively. I note that the O&M amounts presented in my testimony  
21 and attachments include Transmission O&M associated with WMP. Attachment  
22 GYF-2 provides a breakout showing the amount of Transmission WMP O&M  
23 included in each O&M cost category. Mr. Farruggia provides details regarding the  
24 Transmission WMP O&M in his Direct Testimony.

1  
2  
3  
4

**TABLE GYF-D-2:  
Transmission Actual O&M Expenses\*  
Public Service Electric  
(Dollars in Millions)**

<b>Cost Category</b>	<b>12 Months Ended June 30, 2022</b>
Internal Labor	\$15.1
Contract Labor and Consulting	\$6.2
Fees	\$7.0
Materials	\$1.2
Fleet	\$1.2
Other	(\$2.8)
<b>Total</b>	<b>\$28.0</b>
<i>*There may be differences between the sum of the individual category amounts and totals due to rounding. All amounts include WMP O&amp;M.</i>	

- 5 **Q. PLEASE COMPARE TRANSMISSION'S O&M COSTS FOR 2021 TO**  
6 **TRANSMISSION'S O&M COSTS FOR THE 12 MONTHS ENDED JUNE 30,**  
7 **2022.**
- 8 A. Table GYF-D-3 below compares Transmission's actual O&M costs for the 12  
9 months ended December 31, 2021 to actual O&M costs for the 12 months ended  
10 June 30, 2022, by cost category.

1  
2  
3  
4

**TABLE GYF-D-3:  
 Drivers of Transmission O&M Expenses  
 Public Service Electric  
 (Dollars in Millions)**

<b>Cost Category</b>	<b>12 Months Ended December 31, 2021</b>	<b>12 Months Ended June 30, 2022</b>	<b>Test Year Adjustments</b>	<b>Transmission Test Year O&amp;M Expenses</b>
Internal Labor	\$15.0	\$15.1	\$(0.2)	\$14.9
Contract Labor and Consulting	\$6.3	\$6.2	\$(0.4)	\$5.8
Fees	\$6.9	\$7.0	\$(3.2)	\$3.7
Materials	\$1.3	\$1.2		\$1.2
Fleet	\$1.0	\$1.2		\$1.2
Other	\$(2.6)	\$(2.8)	\$4.2	\$1.4
<b>Total Electric</b>	<b>\$27.9</b>	<b>\$28.0</b>	<b>\$0.3</b>	<b>\$28.3</b>
<p><i>*There may be differences between the sum of the individual category amounts and totals due to rounding.            All amounts include Transmission WMP O&amp;M.</i></p>				

5 **Q. CAN YOU PROVIDE MORE INFORMATION REGARDING THE MAIN DRIVERS**  
 6 **OF THE DIFFERENCES SHOWN IN TABLE GYF-D-3?**

7 A. As shown in Table GYF-D-3, the slight increase in O&M expenses from 2021  
 8 actuals to actuals for the 12 months ending June 30, 2022 was due to increases  
 9 in Internal Labor, Fees, and Fleet. The reasons for these increases are as follows:

- 10 • *Internal Labor:* Labor was relatively flat with merit increases offset by  
 11 more labor charged to capital.
- 12 • *Fees:* Fees were relatively flat but there was a slight increase due to  
 13 increased fees for our membership in several regional transmission  
 14 organizations and fees for access to organization research.
- 15 • *Fleet:* Public Service experienced an increase in fleet costs, which was  
 16 driven by a higher fuel and vehicle maintenance costs in 2022.

1 **Q. PLEASE DESCRIBE THE TEST YEAR ADJUSTMENT THAT IS SHOWN IN THE**  
2 **TABLE ABOVE?**

3 A. The Test Year adjustment that is shown in the table above reflects removal of a  
4 one-time net credit for a cancelled project. As this one-time journal entry net credit  
5 for this cancelled project will not reoccur, the Company has removed this net credit.

6 **Q. ARE YOU PROPOSING ANY OTHER ADJUSTMENTS TO THE COMPANY'S**  
7 **O&M EXPENSES TO BE REFLECTED IN THE TEST YEAR FOR**  
8 **TRANSMISSION O&M EXPENSES?**

9 A. Yes. In addition to the net credit I discussed, Public Service is also proposing an  
10 adjustment for Transmission wheeling services costs, which I discuss in Section  
11 VI below.

12 **Q. IS THE COMPANY'S ACTUAL TRANSMISSION O&M EXPENSE FOR THE 12-**  
13 **MONTHS ENDING JUNE 30, 2022, SUBJECT TO ADJUSTMENTS THAT YOU**  
14 **IDENTIFIED, A REASONABLE STARTING BASIS FOR ESTABLISHING**  
15 **TRANSMISSION'S O&M COSTS FOR THE TEST YEAR?**

16 A. Yes. The Company's actual Transmission O&M costs for the 12-months ending  
17 June 30, 2022, subject to the Company's adjustments, are a reasonable basis on  
18 which to establish Transmission's O&M costs for the Test Year. These O&M  
19 expenses are necessary to ensure that the Transmission Business Area is able to  
20 deliver safe and reliable electric service to our Colorado customers.

1                   **VI.           TRANSMISSION WHEELING SERVICES COSTS**

2   **Q.       WHAT IS THE PURPOSE OF THIS SECTION OF YOUR DIRECT TESTIMONY?**

3   A.       In this section of my Direct Testimony, I describe Public Service's use of third-party  
4           wheeling service to transmit power to serve its customers as well as the costs for  
5           these services. My Direct Testimony provides support for the adjustments for  
6           Transmission Wheeling Services included in the Test Year cost of service  
7           sponsored by Mr. Freitas.

8   **Q.       ARE WHEELING COSTS PART OF THE TRANSMISSION AREA'S CAPITAL  
9           AND O&M BUDGETS?**

10 A.       No. These costs are not part of Transmission's capital and O&M budgets I  
11           describe above. These costs are incurred by our Commercial Operations area to  
12           provide transmission access to serve our retail customers and provide  
13           transmission service to import power into the Public Service system.

14 **Q.       WHAT IS WHEELING SERVICE?**

15 A.       Wheeling is an industry term used to describe the transmission of electricity by an  
16           entity that does not own or directly use the electricity that it is transmitting. When  
17           a public utility requires use of the transmission or distribution assets of another  
18           system in order to deliver electricity to its electric customers, it is required to pay a  
19           wheeling charge. In the context of my Direct Testimony, I use the term wheeling  
20           to describe the arrangements that Public Service has entered into with its  
21           neighboring utilities to utilize their transmission and/or distribution systems to serve  
22           Public Service customers in a cost-effective way.

1 **Q. WHY DO UTILITIES ENGAGE IN TRANSMISSION WHEELING?**

2 A. Because the electric grid is an interconnected network, utilities often find that it is  
3 more cost effective to purchase transmission service from others to serve their  
4 electric customers rather than to construct new facilities. Generally, utilities will  
5 utilize wheeling when it is less expensive to purchase wheeling service or where  
6 the construction of new facilities is impractical. Utilities may also purchase  
7 wheeling service from others to serve customers during outage conditions.

8 **Q. DO UTILITIES PURCHASE TRANSMISSION SERVICE FOR REASONS OTHER**  
9 **THAN SERVING THEIR ELECTRIC CUSTOMERS?**

10 A. Yes. In addition to wheeling energy to serve customers, utilities also purchase  
11 wheeling service from others to import generation or to access generation markets.  
12 For example, a utility (or developer) may purchase transmission service to import  
13 generation from a new wind farm or other generator if the generation resource is  
14 not directly interconnected to the utility's core transmission network. A utility may  
15 also purchase Point-to-Point ("PTP") transmission service to access market hubs  
16 outside of its geographic network so that it may have access to those hubs rather  
17 than construct its own native generation. For the purposes of my Direct Testimony,  
18 I include these generation-related uses of third-party transmission service when I  
19 use the term wheeling.

20 **Q. DOES PUBLIC SERVICE PURCHASE WHEELING SERVICE?**

21 A. Much like other electric utilities, Public Service engages in a number of wheeling  
22 transactions to both serve its retail native load, as well as to provide transmission  
23 paths into Public Service's network for its generation and market access. In each

1 case, Public Service's use of wheeling service avoids the need to construct  
2 duplicative assets that would either be costlier than purchasing wheeling service  
3 or are impractical to build or acquire.

4 **Q. WHAT ARE THE WHEELING TRANSACTIONS IN WHICH PUBLIC SERVICE**  
5 **ENGAGES?**

6 A. Attachment GYF-4 identifies Public Service's wheeling transactions for which  
7 recovery is being requested in base rates, along with a description of each  
8 transaction. As reflected in Attachment GYF-4, the Company is seeking to recover  
9 \$21 million in wheeling expense.

10 **Q. HAVE WHEELING COSTS INCREASED SINCE THE COMPANY'S 2021**  
11 **ELECTRIC PHASE I RATE CASE?**

12 A. Yes. Public Service's July 1, 2021 to June 30, 2022 wheeling costs, not including  
13 adjustments, were approximately \$1.2 million higher than the wheeling costs  
14 included in the 2021 Electric Phase I proceeding that used calendar year 2020  
15 level of O&M expense.

16 **Q. WHAT DROVE THIS INCREASE IN COSTS FROM 2020 TO THE JULY 1, 2021**  
17 **TO JUNE 30, 2022 PERIOD?**

18 A. Changes in wheeling costs were primarily driven by increased costs of the Four  
19 Corners-Craig path on Public Service, offset by cost reductions on other wheeling  
20 paths.

1 **Q. IS PUBLIC SERVICE UTILIZING JULY 1, 2021 TO JUNE 30, 2022 ACTUAL**  
2 **WHEELING COSTS TO ESTABLISH ITS COST OF SERVICE IN THIS**  
3 **PROCEEDING?**

4 A. Yes, as Mr. Freitas discusses, the Test Year cost of service starts with July 1, 2021  
5 to June 30, 2022 actual O&M costs, but the level of wheeling expenses requested  
6 in this rate case has been adjusted for known Test Year adjustments.

7 **Q. DOES ATTACHMENT GYF-4 INCLUDE ALL WHEELING COST**  
8 **ADJUSTMENTS INCLUDED IN THE TEST YEAR?**

9 A. No. In addition to the Test Year adjustments to July 2021 to June 2022 costs I  
10 discuss below, Public Service has excluded certain wheeling costs collected  
11 through the Electric Commodity Adjustment (“ECA”).

12 **Q. WHAT TEST YEAR ADJUSTMENTS TO THE COST OF WHEELING SERVICES**  
13 **IS PUBLIC SERVICE PROPOSING TO MAKE?**

14 A. Public Service has proposed four types of Test Year adjustments: (1) Economic  
15 Purchases, (2) Trading Activity, (3) Sales for Resale, and (4) Prior-Year True-Ups.

16 Economic purchases refers to the procurement of point to point  
17 transmission service on other transmission systems due to elevated system  
18 conditions; to the extent these costs, when combined with the associated energy  
19 purchase, are deemed economic, they are recovered through the ECA.  
20 Accordingly, wheeling expenses were adjusted by \$1,963,047 to exclude such  
21 costs incurred in July 2021 to June 2022.

22 Trading Activity refers to wheeling charges associated with proprietary  
23 and/or off-system trading activity (which are included in the calculation of trading

1 margins and shared with customers through the ECA); therefore, an adjustment of  
2 \$3,188,981 is necessary to exclude these amounts from wheeling expense.

3 Sales for resale refers to PTP transmission service that is procured from  
4 Tri-State in order to serve a wholesale customer, and approximately \$340,224 of  
5 associated wheeling expense has been excluded.

6 Prior-period true-ups includes an adjustment of (\$158,070) to exclude  
7 accounting adjustments recorded in July 2021 to June 2022 related to the true-up  
8 of Public Service's 2021 and 2022 Transmission Integration and Equalization  
9 Agreement with Holy Cross Electric Association, Inc.

10 In total, Public Service proposes a net decrease of \$5,334,181 to the  
11 Company's July 2021 to June 2022 actual Transmission O&M levels to account  
12 for its adjustments, which is reflected in the column "2022 Adjusted" in the table  
13 included on page 2 of Attachment GYF-4.

14 **Q. DOES THIS CONCLUDE YOUR DIRECT TESTIMONY?**

15 A. Yes, it does.

## **Statement of Qualifications**

### **Gilbert Y. Flores**

Gilbert Y. Flores is the Manager of Transmission Planning for Public Service Company of Colorado. In this position, Gilbert has responsibility for overseeing the engineering group responsible for planning the transmission system and is also responsible for the development of Transmission budgets, regulatory compliance and portions of the operations and maintenance (“O&M”) of Public Service’s transmission system. Since 2022, Gilbert has had responsibility for overseeing transmission policy and projects involving participation with other utilities, including conducting strategic analyses for potential transmission projects, evaluating joint agreements, and engaging in stakeholder outreach. Gilbert previously held the role of Regional Transmission Planning Engineer focusing on Colorado and the WestConnect regional group. Gilbert’s responsibilities included regional transmission expansion studies across Colorado, evaluation of strategic company initiatives, as well as FERC Order 1000 compliance. As Regional Planner, Gilbert led the Company’s latest Rule 3627 10 Year Transmission Plan filed early 2022. Gilbert is currently the Vice-Chair over the WestConnect Planning Management Committee and participates in the WestConnect Planning Subcommittee supporting the two-year WestConnect Planning cycle.

Gilbert joined Xcel Energy in 2012. From 2012 through the end of 2014, Gilbert served as a Distribution Area Engineer focusing on reliability, power quality, and ensured designers and construction crews complied with Company design requirements at the Distribution system level. From 2014 to 2016, Gilbert served as a Substation Standards Engineer. In that role, he developed material standards for various substation equipment

as well as developed multiple companywide standards establishing criteria such as substation design clearances. From 2016 to 2017, Gilbert was the Substation System Performance Engineer focusing on the Company's substation asset renewal program. In this role, he initiated and drove to completion many replacement and reconditioning projects in Colorado. In 2017 to 2020, Gilbert served as a Transmission Planning Engineer for Public Service of Colorado. In this role, Gilbert developed WECC model cases and conducted system studies related to load growth and power quality, as well as supported NERC and FERC compliance. Further, Gilbert participated in the Company's internal annual budget as the Transmission Planning representative to ensure project priority and alignment with Company goals.

Gilbert graduated from the University of Houston in 2009 with a Bachelor of Science in Electrical Power Engineering Technology where he was recognized for scholastic achievement in undergraduate studies. In 2018, Gilbert earned a Master of Science in Electrical Engineering with a focus on Power and Energy Systems from Colorado School of Mines. Gilbert has been recognized by EPRI for his work in the development of EPRI's Grid Strength Assessment Tool and awarded a Technology Transfer Award in 2021. Gilbert is a veteran and licensed Professional Engineer in the State of Colorado.
