Case No. 22-00286-UT
Direct Testimony
of
Dane A. Watson

1 **I. WITNESS IDENTIFICATION AND QUALIFICATIONS**

2 **Q. Please state your name and business address.**

3 A. My name is Dane A. Watson. My business address is 101 E. Park Blvd. Suite 220,
4 Plano, Texas 75074.

5 **Q. On whose behalf are you testifying in this proceeding?**

6 A. I am filing testimony on behalf of Southwestern Public Service Company, a New
7 Mexico corporation (“SPS”) and wholly owned electric utility subsidiary of Xcel
8 Energy Inc.

9 **Q. By whom are you employed and in what position?**

10 A. I am a Partner of Alliance Consulting Group. Alliance Consulting Group provides
11 consulting and expert services to the utility industry.

12 **Q. Please describe your educational background.**

13 A. Since graduation from college in 1985, I have worked in the area of depreciation
14 and valuation. I founded Alliance Consulting Group in 2004 and am responsible
15 for conducting depreciation, valuation, and certain accounting-related studies for
16 clients in various industries. My duties related to depreciation studies include the
17 assembly and analysis of historical and simulated data, conducting field reviews,
18 determining service life and net salvage estimates, calculating annual depreciation,

Case No. 22-00286-UT
Direct Testimony
of
Dane A. Watson

1 presenting recommended depreciation rates to utility management for its
2 consideration, and supporting such rates before regulatory bodies.

3 My prior employment from 1985 to 2004 was with Texas Utilities Electric
4 Company and successor companies (“TXU”). During my tenure with TXU, I was
5 responsible for, among other things, conducting valuation and depreciation studies
6 for the domestic TXU companies. During that time, I served as Manager of
7 Property Accounting Services and Records Management in addition to my
8 depreciation responsibilities.

9 I have twice been Chair of the Edison Electric Institute (“EEI”) Property
10 Accounting and Valuation Committee and have been Chairman of EEI’s
11 Depreciation and Economic Issues Subcommittee. I am a Registered Professional
12 Engineer in the State of Texas and a Certified Depreciation Professional. I am a
13 Senior Member of the Institute of Electrical and Electronics Engineers (“IEEE”)
14 and served for several years as an officer of the Executive Board of the Dallas
15 Section of IEEE as well as national and worldwide offices. I have served as
16 President of the Society of Depreciation Professionals (“SDP”) twice.

17 **Q. Do you hold any special certification as a depreciation expert?**

18 A. Yes. The SDP has established national standards for depreciation professionals.
19 The SDP administers an examination and has certain required qualifications to

Case No. 22-00286-UT
Direct Testimony
of
Dane A. Watson

1 become certified in this field. I met all requirements and hold a Certified
2 Depreciation Professional certification.

3 **Q. Have you previously testified before regulatory authorities?**

4 A. Yes. I have testified in more than 300 different proceedings before more than 35
5 different regulatory bodies including before the New Mexico Public Regulation
6 Commission (“Commission”). A list of proceedings in which I have provided
7 testimony is provided in Attachment DAW-1.

1 **II. ASSIGNMENT AND SUMMARY OF TESTIMONY AND**
2 **RECOMMENDATIONS**

3 **Q. What is your assignment in this proceeding?**

4 A. The purpose of my testimony is to:

- 5 • discuss the SPS–New Mexico Technical Update Depreciation Accrual
6 Rate Study at June 30, 2024, completed for SPS assets (“Technical
7 Update”); and
- 8 • support and justify the recommended depreciation rate changes for SPS
9 assets for the future test year of July 1, 2023 through June 30, 2024 (the
10 “Future Test Year”), based on the results of the Technical Update.

11 In addition, I co-sponsor Schedule C-2 in the Rate Filing Package.

12 **Q. Please summarize your conclusions regarding depreciation rate changes for**
13 **SPS assets based on the results of the Technical Update.**

14 A. The Technical Update performed under my supervision fully supports SPS’s
15 proposed depreciation rates applied to June 30, 2024 depreciable plant balances for
16 Steam Production plant, Other Production plant, Transmission plant, Distribution
17 plant (New Mexico only), and General Property plant. The calculation
18 methodology in the Technical Update follows the Commission’s long-standing
19 precedent for Average Life Group (“ALG”) straight-line depreciation. In this way,
20 all customers are charged for their appropriate share of the capital expended for
21 their benefit. Using the straight-line approach and the parameters recommended in

Case No. 22-00286-UT
Direct Testimony
of
Dane A. Watson

1 my study, the Commission should adopt the depreciation rates proposed in this
2 Technical Update. SPS’s depreciation rates should be set at the levels supported in
3 the Technical Update in order to enable SPS to recover its total investment in
4 property over the estimated remaining life of the assets.

5 **Q. Please describe your process for the Technical Update.**

6 A. The Technical Update retains the lives and net salvage values proposed and
7 supported by my full depreciation study in Case No. 19-00170-UT¹ (the “2019
8 Depreciation Study”), with the exception of updated terminal retirement dates for
9 certain production assets, as discussed below. The 2019 Depreciation Study is
10 attached as Attachment DAW-2.

11 There has also been additional investment in all asset accounts and additions
12 to their respective depreciation reserves since the 2019 Depreciation Study. New
13 investment and additions to depreciation reserves will continue through the end of
14 the Future Test Year. The projected plant balances and depreciation reserves as of
15 June 30, 2024 that were used in this Technical Update were provided to me by SPS,

¹ *In the Matter of Southwestern Public Service Company’s Application for: (1) Revision of its Retail Rates under Advice Notice No. 282; (2) Authorization and Approval to Shorten the Service Life of and Abandon its Tolk Generating Station Units; and (3) Other Related Relief*, Case No. 19-00170-UT, Certificate of Stipulation at 40-41 (Dec. 21, 2021).

Case No. 22-00286-UT
Direct Testimony
of
Dane A. Watson

1 as discussed in more detail below. Using this updated information, new average
2 remaining life depreciation rates for Steam Production plant, Other Production
3 plant, Transmission plant, Distribution plant, and General plant were calculated.

4 **Q. Have you performed any other Technical Updates for SPS’s depreciation rates**
5 **since the 2019 Depreciation Study?**

6 A. Yes. In Case No. 20-00238-UT, I also performed a Technical Update (the “2020
7 Technical Update”) based on the 2019 Depreciation Study. Similar to the current
8 Technical Update, the 2020 Technical Update retained the lives and net salvage
9 values proposed and supported by the 2019 Depreciation Study, with the exception
10 of updated terminal retirement dates for certain production assets.

11 **Q. Are SPS’s current depreciation rates consistent with the results of your 2020**
12 **Technical Update?**

13 A. Yes. As agreed to by the parties in settlement, the Commission approved new
14 depreciation rates consistent with my 2020 Technical Update in Case No.
15 20-00238-UT.²

² *In the Matter of Southwestern Public Service Company’s Application for: (1) Revision of its Retail Rates Under Advice Notice No. 292; (2) Authorization and Approval to Abandon its Plant X Unit 3 generating Station; and (3) Other Associated Relief, Case No. 20-00238-UT, Certificate of Stipulation at 78-79, 116 (Dec. 21, 2021).*

Case No. 22-00286-UT
Direct Testimony
of
Dane A. Watson

1 **Q. Are the terminal retirement dates for production assets that you used in the**
2 **current Technical Update identical to those you used in your 2020 Technical**
3 **Update?**

4 A. No, SPS has made a few changes to its terminal retirement dates for production
5 assets since the 2020 Technical Update. As presented by SPS in this proceeding,
6 SPS currently projects that the Tolk Generating Station will be retired in 2028,
7 rather than 2032 as assumed in the 2020 Technical Update, and is requesting
8 Commission authority to retire coal operations at Tolk Generating Station by
9 December 31, 2028. Additionally, as discussed by SPS witness Ben R. Elsey, the
10 projected terminal retirement dates for Nichols Units 1 and 2 have been extended
11 to 2028 and 2027, respectively, in comparison with the 2022 and 2023 retirement
12 dates included in the 2020 Technical Update, in order to meet the Southwest Power
13 Pool's increased minimum planning reserve margin requirement in 2023. The
14 terminal retirement dates for Cunningham Unit 1 and Plant X Units 1 and 2 have
15 also shifted slightly; however, those plant balances will be fully accrued prior to
16 the end of the Future Test Year.³

³ A comparison between the current and proposed generation terminal retirement dates can be found at Attachment DAW-4.

Case No. 22-00286-UT
Direct Testimony
of
Dane A. Watson

1 **Q. Why are you performing a Technical Update instead of a full Depreciation**
2 **Study in this proceeding?**

3 A. The Technical Update conserves resources and provides accurate depreciation rates
4 by applying the factors from the 2019 Depreciation Study (with the exception of
5 the updated generation retirement dates discussed above) to Future Test Year
6 balances. SPS's updated generation unit retirement dates are the only material
7 changes that have occurred since the 2019 Depreciation Study. Other than those
8 terminal retirement dates, all factors in determining depreciation rates (such as
9 interim retirement curves, dismantling costs, life parameters and net salvage
10 parameters) as recently proposed in and supported by the 2019 Depreciation Study
11 were retained.

12 **Q. How was the Technical Update used to determine SPS's depreciation expense**
13 **for the Future Test Year?**

14 A. SPS used the depreciation rates determined in the Technical Update to calculate the
15 appropriate depreciation expense for the Future Test Year. SPS witness Mark P.
16 Moeller discusses the impact of the new depreciation rates on SPS's Test Year
17 depreciation expense in his direct testimony.

Case No. 22-00286-UT
Direct Testimony
of
Dane A. Watson

1 **Q. Were Attachments DAW-1 through DAW-7 prepared by you or under your**
2 **direct supervision and control?**

3 A. Yes.

4 **Q. Was the Rate Filing Package schedule that you are co-sponsoring prepared by**
5 **you or under your supervision?**

6 A. Yes.

1 **III. DEPRECIATION ANALYSIS PHILOSOPHY**

2 **Q. What definition of depreciation did you use in preparing your Technical**
3 **Update and testimony?**

4 A. The term “depreciation,” as I use it, is a system of accounting that distributes the
5 cost of assets, less net salvage (if any), over the estimated useful life of the assets
6 in a systematic and rational manner. It is a process of allocation, not valuation.
7 Depreciation expense is systematically allocated to accounting periods over the life
8 of the assets. The amount allocated to any one accounting period does not
9 necessarily represent the loss or decrease in value that will occur during that period.
10 Thus, depreciation is considered an expense or cost, rather than a loss or decrease
11 in value. SPS accrues depreciation based on the original cost of all property
12 included in each depreciable plant account. On retirement, the full cost of
13 depreciable property, less any net salvage amount, is charged to the depreciation
14 reserve.

15 **Q. Please describe the depreciation analysis philosophy reflected in the current**
16 **Technical Update.**

17 A. The objective of any sound depreciation philosophy should be the matching of
18 expense with revenue over the life of the asset. In general, the life of the asset is
19 determined by several factors including the rate of physical deterioration,

Case No. 22-00286-UT
Direct Testimony
of
Dane A. Watson

1 obsolescence, weather, maintenance, or in some cases, the economic usefulness of
2 an entire operating unit. The function of depreciation is to spread the cost of an
3 asset over its useful life. Book depreciation techniques should not accelerate or
4 defer the recovery of an asset in comparison to its appropriate useful life.

5 **Q. What objective do you recommend a regulatory authority seek to achieve in**
6 **setting depreciation rates?**

7 A. As a general matter, the objective of computing depreciation is to ensure that
8 customers using the assets pay their pro rata share for the investment, including the
9 cost of retirement, while the asset is in service. This objective is achieved by
10 allocating the cost or depreciable base of a group of assets over the service life of
11 those assets, on a straight-line basis, by charging a portion of the consumption of
12 the assets to each accounting period.

13 **Q. Is this objective consistent with this Commission's rules and historical**
14 **practice?**

15 A. Yes. Commission Rule 17.3.340.10 NMAC adopts the straight-line method as the
16 default methodology for calculating depreciation rates. Furthermore, the
17 Commission has a long-standing practice of establishing depreciation rates using
18 the straight-line depreciation method based on the actual historical data of the

Case No. 22-00286-UT
Direct Testimony
of
Dane A. Watson

1 utility.⁴ The straight-line method of depreciation operates by collecting a pro rata
2 share of the cost of the investment, including removal cost, from the customers that
3 receive the benefit of the asset over its useful life.

4 **Q. What is the best evidence the Commission can rely on to ensure that the cost**
5 **of certain assets are ratably recovered over the service life of the asset?**

6 A. The best evidence is the actual experience of the specific group of assets being
7 analyzed. This evidence is found in the 2019 Depreciation Study and in the
8 Technical Update based on plant investment in service at June 30, 2024.

9 **Q. What happens when depreciation rates are not adjusted to reflect the actual**
10 **life and retirement characteristics of the assets?**

11 A. When depreciation rates are set at a level that does not reflect the most current
12 actual life and retirement characteristics of a utility's assets, the cost of the asset
13 will not be recovered on a pro rata basis from the customers that benefit from the
14 use of the asset during its service life. For example, if the life for certain assets
15 change such that there is insufficient depreciation expense under current rates to
16 fully recover the cost of the assets over their remaining lives, SPS will not fully

⁴ For example, the Commission approved the straight-line depreciation method presented by SPS in Case Nos. 19-00170-UT, 12-00350-UT, and 07-00319-UT.

Case No. 22-00286-UT
Direct Testimony
of
Dane A. Watson

1 accrue the cost of the assets by the end of the lives of the assets. This, in turn,
2 means that future customers would pay a disproportionate share of the costs to make
3 up for the payment deferrals.

Case No. 22-00286-UT
Direct Testimony
of
Dane A. Watson

1 IV. **SPS TECHNICAL UPDATE**

2 **Q. Please describe the Technical Update you conducted for SPS.**

3 A. I calculated depreciation rates at June 30, 2024 using: (1) the life and net salvage
4 parameters supported by my 2019 Depreciation Study (adjusting the terminal
5 retirement dates for certain generation assets as discussed above); and (2) projected
6 investment and depreciation reserve values as of the end of the Future Test Year.

7 **Q. What is the basis for the projected investment and depreciation reserve values**
8 **that you used in performing the Technical Update?**

9 A. SPS provided me with the projected investment and depreciation reserve values as
10 of the end of the Future Test Year. Mr. Moeller describes the roll-forward process
11 SPS used to develop these values in his direct testimony.

12 **Q. What depreciation rates are you recommending in this proceeding?**

13 A. My recommended depreciation rates for SPS, including a comparison with current
14 rates, are provided in Attachment DAW-6 to this testimony. Detailed computations
15 supporting my recommended rates are shown in Attachment DAW-5. Current lives
16 and net salvage factors (based on my 2020 Technical Update as approved by the
17 Commission in Case No. 20-00238-UT) as well as those used in the Technical
18 Update are found in Attachment DAW-3. Current and proposed terminal

Case No. 22-00286-UT
Direct Testimony
of
Dane A. Watson

1 retirement dates for production facilities are found in Attachment DAW-4.
2 Workpapers supporting the calculations are included in Attachment DAW-7.

3 **Q. Why did the depreciation rates for assets other than those production assets**
4 **with changed retirement dates change in this Technical Update in comparison**
5 **with the 2019 Depreciation Study?**

6 A. Although the lives and net salvage parameters are the same as in the 2019
7 Depreciation Study, depreciation rates for these assets changed from the 2019
8 Depreciation Study for two reasons. First, as discussed above, the investment and
9 depreciation reserves were updated to reflect projected balances at June 30, 2024
10 in the depreciation rate calculations. Second, the Technical Update reallocated the
11 depreciation reserve within each function.

12 **Q. What is your recommendation as to the depreciation rates that will be set in**
13 **this proceeding?**

14 A. I recommend the Commission approve SPS's proposed depreciation rates, which
15 have been updated to more accurately reflect current and projected investment and
16 depreciation reserve balances for all assets and accurate service life expectations
17 for SPS's existing generation assets. The depreciation rates proposed in the
18 Technical Update more accurately reflect SPS's current experience and future

Case No. 22-00286-UT
Direct Testimony
of
Dane A. Watson

1 expectations and also allow for the recovery of depreciation expense that would
2 otherwise be under-accrued. In addition, adoption of the proposed depreciation
3 rates should ensure, going forward, that current SPS customers pay their pro-rata
4 share of the investment over the remaining life of the investment. This ensures that
5 future customers are not unduly burdened by having to pay a disproportionate share
6 of any remaining investment balance for removal costs at the end of the asset's life.

7 **Q. Does this conclude your pre-filed direct testimony?**

8 A. Yes.

PURPOSE

The purpose of this study is to develop functional depreciation rates for the depreciable Production, Transmission, Distribution, and General Property as recorded on the books of Southwestern Public Service Company – New Mexico (“SPS” or the “Company”) as of December 31, 2018. The depreciation rates were designed to recover the total remaining undepreciated investment, adjusted for net salvage, over the remaining life of SPS’s property on a straight-line basis. Non-depreciable property was excluded from this study. SPS is engaged in the generation, transmission, and distribution of electricity within Texas and New Mexico.

Company-wide (Texas and New Mexico), SPS provides electricity to approximately 400,000 wholesale and retail customers. Assets for SPS at December 31, 2018 include: 4,406 megawatts of generation; 9,028 conductor miles of 345 kV transmission lines with supporting structures; 9,675 conductor miles of 230 kV transmission lines with supporting structures; 14,493 conductor miles of 115 kV transmission line with supporting structures; 25,820 conductor miles of less than 115 kV line and 459 transmission and distribution substations. In addition, SPS utilizes associated equipment such as feeders, primary switches, poles, conductor, line transformers, services, meters, and street lights to serve its customers.

General Property assets such as buildings, office furniture, transportation equipment, and other miscellaneous property are located throughout SPS’ service territory.

STUDY RESULTS

Recommended depreciation rates for all SPS depreciable property are shown in Appendix A. These rates translate into an annual depreciation accrual (total company) for Production of \$80.0 million, for Transmission, Distribution, and General Property plant of \$129.9 million, and for Intangible plant of \$26.3 million. These accruals are based on SPS' depreciable investment as of December 31, 2018 as shown in Appendix B. The annual depreciation expense calculated by the same method using the existing approved SPS New Mexico depreciation rates was \$48.7 million for Production, \$113.6 million for Transmission, Distribution, and General Property plant and \$26.3 million for Intangible plant. Appendix B shows the effect of the change in lives, net salvage and curves on depreciation accrual by account. The proposed lives, net salvage and curves on which these calculations are based are shown in Appendix C-1 and C-2. Appendix D shows the production unit retirement dates. Appendix E addresses the development of net salvage parameters for all plant accounts, by providing the net salvage history. Appendix F shows the comparison of book depreciation reserve to the reallocated reserve and the difference. Appendix G shows the allocation of dismantling costs broken down to the generating unit and plant account. Appendix H shows the computation of composite net salvage for generating unit and plant account.

Since New Mexico Case No. 07-00319-UT, SPS has been using general plant amortization (vintage group amortization) for general plant (excluding Accounts 389 and 390). SPS is presenting updated estimates of life and net salvage for general plant for Accounts 391-398. In this proceeding, SPS requests that the depreciation study parameters (life and net salvage) for general plant be approved.

GENERAL DISCUSSION

Definition

The term "depreciation" as used in this study is considered in the accounting sense; that is, a system of accounting that distributes the cost of assets, less net salvage (if any), over the estimated useful life of the assets in a systematic and rational manner. It is a process of allocation, not valuation. This expense is systematically allocated to accounting periods over the life of the properties. The amount allocated to any one accounting period does not necessarily represent the loss or decrease in value that will occur during that particular period. SPS accrues depreciation on the basis of the original cost of all depreciable property included in each functional property group. At retirement, the full cost of depreciable property, less the net salvage value, is charged to the depreciation reserve.

Basis of Depreciation Estimates

Annual and accrued depreciation rates were calculated in this study by the straight-line, broad group, remaining-life depreciation system. In this system, the annual depreciation expense for each group is computed by dividing the original cost of the asset group less allocated depreciation reserve less estimated net salvage by its respective average remaining life. The resulting annual accrual amounts of all depreciable property within a function were accumulated and the total was divided by the original cost of all functional depreciable property to determine the depreciation rate. The calculated remaining lives and annual depreciation accrual rates were based on attained ages of plant in service and the estimated service life and salvage characteristics of each depreciable group, and were computed in a direct weighting by multiplying each vintage or account balance times its remaining life and dividing by the plant investment in service as of December 31, 2018. The computations of the annual functional depreciation rates are shown in Appendix A, and the weighted remaining life calculations are also shown in Appendix A.

A variety of life estimation approaches were incorporated into analyses of SPS

data. Both Simulated Plant Record (“SPR”) analysis and Actuarial Analysis are commonly used mortality analysis techniques for electric utility property. Historically, SPS has used SPR analysis to evaluate lives of most asset groups. Where vintaged information is available, actuarial analysis was performed. Transmission, Distribution structures and improvements, Distribution substations, and General Property accounts were analyzed in this study using actuarial analysis. Production interim retirement curves and Mass Distribution accounts (Accounts 364–373) were analyzed using SPR analysis. For the accounts using actuarial analysis, (*i.e.*, Accounts 350-362 and 389-398) experience bands varied depending on the amount of data. The 1968-2018 experience band was the maximum used for Accounts 352-362 and General Property Accounts 390-398. Judgment was used on all accounts. Each approach used in this study is more fully described in a later section.

Survivor Curves

To fully understand depreciation projections in a regulated utility setting, there must be a basic understanding of survivor curves. Individual assets within a group do not normally have identical lives or investment amounts. The average life of a group can be determined by comparing actual experience against various survivor curves. A survivor curve represents the percentage of property remaining in service at various age intervals. The most widely used set of representative survivor curves are the Iowa Survivor Curves (Iowa Curves). The Iowa Curves are the result of an extensive investigation of life characteristics of physical property made at Iowa State College Engineering Experiment Station in the first half of the twentieth century. Through common usage, revalidation, and regulatory acceptance, these curves have become a descriptive standard for the life characteristics of industrial property. An example of an Iowa Curve is shown below.

There are four families in the Iowa Curves which are distinguished by the relation of the age at the retirement mode (largest annual retirement frequency) and the average life. The four families are designated as “R”— Right, “S” — Symmetric, “L” — Left, and “O” — Origin Modal. First, for patterns with the mode age greater than the average life, an "R" designation (*i.e.*, Right modal) is used. The family of “R” moded curves is shown below.

Second, an "S" designation (*i.e.*, Symmetric modal) is used for the family whose mode age is symmetric about the average life. Third, an "L" designation (*i.e.*, Left modal) is used for the family whose mode age is less than the average life. Fourth, a special case of left modal dispersion is the "O" or origin modal curve family. Within each curve family, numerical designations are used to describe the relative magnitude of the retirement frequencies at the mode. A "6" indicates that the retirements are not greatly dispersed from the mode (*i.e.*, high mode frequency) while a "1" indicates a large dispersion about the mode (*i.e.*, low mode frequency). For example, a curve with an average life of 30 years and an "L3" dispersion is a moderately dispersed, left modal curve that can be designated as a 30 L3 Curve. An SQ, or square, survivor curve occurs where no dispersion is present (*i.e.*, units of common age retire simultaneously).

For Production interim retirement curves, Transmission, Distribution, and General Property accounts, a survivor curve pattern was selected based on analysis of historical data, as well as other factors, such as general changes relevant to SPS's operations. The blending of judgment concerning current conditions and future trends, along with the matching of historical data permits the depreciation analyst to make an informed selection of an account's average life and retirement dispersion pattern. Iowa Curves were used to depict the estimated survivor curves for each account.

Life Span Procedure

The life span procedure was used for production facilities for which most components are expected to have a retirement date concurrent with the planned retirement date of the generating unit. The terminal retirement date refers to the year that each unit will cease operations. The estimated terminal retirement dates for the various generating units were provided by SPS based on determinations made by SPS management, financial, and engineering staff. Those estimated terminal retirement dates are shown in Appendix D.

Interim Retirement Curves

Interim retirement curves were used to model the retirement of individual assets within primary plant accounts for each steam and other production generating unit prior to the terminal retirement of the facility. The life span procedure assumes all assets are depreciated (straight-line) for the same number of periods and retire at the same time (the terminal retirement date). Adding interim retirement curves to the procedure reflects the fact that some of the assets at a power plant will not survive to the end of the life of the facility and should be depreciated (straight-line) more quickly and retired earlier than the terminal life of the facility. The goal of interim retirement curves is to project how many of the assets that are currently in service will retire each year in the future using historical analysis and judgment. These curves were chosen based primarily on an analysis of the historical retirement pattern of the Steam and Other Production assets and consultation with SPS personnel. Interim retirements for each plant account were modeled using Iowa Curves discussed above. By applying interim

retirements, recognition is given to the obvious fact that generating units will have retirements of depreciable property before the end of their lives.

Although interim retirements have been recognized in the study, interim additions to existing facilities in service at December 31, 2018 (*i.e.*, future additions) have been excluded from the study. The estimated amount of future additions might or might not occur. However, there is no uncertainty as to whether the full level of interim retirements will happen. The assets that are being modeled for retirement are already in rate base. Steam and Other Production depreciation rates using interim retirements are known and measurable in the same way that setting depreciation rates for transmission or distribution property using Iowa Curves is known and measurable. There is no depreciable asset that is expected to live forever. All assets at a power plant will retire at some point. Interim retirements simply model when those retirements will occur in the same way that is done for transmission or distribution assets. The depreciation rates adopted in Case No. 12-00350-UT (Recommended Decision establishing SPS's existing New Mexico depreciation rates) incorporated an interim retirement component for Steam Production Plant.

Actuarial Analysis

Actuarial analysis (retirement rate method) was used in evaluating historical asset retirement experience where vintage data were available and sufficient retirement activity was present. In actuarial analysis, interval exposures (total property subject to retirement at the beginning of the age interval, regardless of vintage) and age interval retirements are calculated. The complement of the ratio of interval retirements to interval exposures establishes a survivor ratio. The survivor ratio is the fraction of property surviving to the end of the selected age interval, given that it has survived to the beginning of that age interval. Survivor ratios for all of the available age intervals were chained by successive multiplications to establish a series of survivor factors, collectively known as an observed life table. The observed life table shows the experienced mortality characteristic of the account and may be compared to standard mortality curves such as the Iowa Curves. Many accounts were analyzed using this method. Placement bands were used to illustrate the composite history over a specific

era, and experience bands were used to focus on retirement history for all vintages during a set period. Matching data in observed life tables for each experience and placement band to an Iowa Curve requires visual examination. As stated in Depreciation Systems by Wolf and Fitch, “the analyst must decide which points or sections of the curve should be given the most weight. Points at the end of the curve are often based on fewer exposures and may be given less weight than those points based on larger samples” (page 46). Some analysts chose to use mathematical fitting as a tool to narrow the population of curves using a least squares technique. Use of the least squares approach does not imply a statistical validity, however, because the underlying data does not meet criteria for independence between vintages and the same average price for property units through time. Thus, Depreciation Systems cautions, “... the results of mathematical fitting should be checked visually and the final determination of best fit made by the analyst” (page 48). This study uses the visual matching approach to match Iowa Curves, since mathematical fitting produces theoretically possible curve matches. Visual examination and experienced judgment allow the depreciation professional to make the final determination as to the best curve type.

Detailed information for each account is shown later in this study and in workpapers.

Simulated Plant Record Procedure

The SPR - Balances approach is one of the commonly accepted approaches to analyze mortality characteristics of utility property. SPR was applied to production interim retirement curves and Distribution (Accounts 364-373), due to the unavailability of vintaged transactional data. In this method, an Iowa Curve and average service life are selected as a starting point of the analysis and its survivor factors applied to the actual annual additions to give a sequence of annual balance totals. These simulated balances are compared with the actual balances by using both graphical and statistical analysis. Through multiple comparisons, the mortality characteristics (as defined by an average life and Iowa Curve) that are the best match to the property in the account can be found.

The Conformance Index (“CI”) is one measure used to evaluate various SPR analyses. CIs are also used to evaluate the "goodness of fit" between the actual data and the Iowa Curve being referenced. The sum of squares difference (“SSD”) is a summation of the difference between the calculated balances and the actual balances for the band or study year being analyzed. This difference is squared and then summed to arrive at the SSD.

$$SSD = \sum_i^n (Calculated\ Balance_i - Observed\ Balance_i)^2$$

Where n is the number of years in the test band.

This calculation can then be used to develop other calculations, which the analyst feels might give a better indication for the “goodness of fit” for the representative curve under consideration. The residual measure (“RM”) is the square root of the average squared differences as developed above. The residual measure is calculated as follows:

$$RM = \sqrt{\left(\frac{SSD}{n} \right)}$$

The CI is developed from the residual measure and the average observed plant balances for the band or study year being analyzed. The calculation of conformance index is shown below:

$$CI = \frac{\sum_i^n Balances_i / n}{RM}$$

The retirement experience index (“REI”) gives an indication of the maturity of the account and is the percent of the property retired from the oldest vintage in the band at the end of the study year. Retirement indices range from zero percent to 100 percent and an REI of 100 percent indicates that a complete curve was used. An REI less than 100 percent indicates that the survivor curve was truncated at that point. The originator of the SPR method, Alex Bauhan, suggests ranges of value for the CI and REI. The

relationship for CI proposed by Bauhan is shown below¹:

CI	Value
Over 75	Excellent
50 to 75	Good
25 to 50	Fair
Under 25	Poor

The relationship for REI proposed by Bauhan² is shown below:

REI	Value
Over 75	Excellent
50 to 75	Good
33 to 50	Fair
17 to 33	Poor
Under 17	Valueless

Despite the fact there has not been empirical research to validate Bauhan's conclusions, depreciation analysts have used these measures in analyzing SPR results for nearly 60 years, since the SPR method was developed.

¹ Public Utility Depreciation Practices, p. 96. National Association of Regulatory Utility Commissioners, 1996.

² Public Utility Depreciation Practices, p. 97. National Association of Regulatory Utility Commissioners, 1996.

Each of these statistics provides the analyst with a different perspective of the comparison between a band of simulated or calculated balances and the observed or actual balances in the account being studied. Although one statistic is not necessarily superior over the others, the conformance index is the one many analysts use in depreciation studies. The depreciation analyst should carefully weigh the data from REIs to ensure that a mature curve is being used to estimate life.

Statistics are useful in analyzing mortality characteristics of accounts as well as determining a range of service lives to be analyzed using the detailed graphical method. However, these statistics boil all the information down to one, or at most, a few numbers for comparison. Visual matching through comparison between actual and calculated balances expands the analysis by permitting the analyst to view many points of data at a time. The goodness of fit should be visually compared to plots of other Iowa Curve dispersions and average lives for the selection of the appropriate curve and life. Detailed information for each account is shown later in this study and in workpapers.

Judgment

Any depreciation study requires informed judgment by the analyst conducting the study. A knowledge of the property being studied, company policies and procedures, general trends in technology and industry practice, and a sound basis of understanding depreciation theory are needed to apply this informed judgment. In this depreciation study, judgment was used in areas such as survivor curve modeling and selection, depreciation method selection, SPR method analysis, and actuarial analysis.

Where there are multiple factors, activities, actions, property characteristics, statistical inconsistencies, property mix in accounts or a multitude of other considerations that affect the analysis (potentially in various directions), judgment is used to take all of these considerations and synthesize them into a general direction or understanding of the characteristics of the property. Individually, no one consideration in these cases may have a substantial impact on the analysis, but overall, the collective effect of these considerations may shed light on the use and characteristics of assets. Judgment may also be defined as deduction, inference, wisdom, common sense, or the ability to make sensible decisions. There is no single correct result from statistical

analysis; hence, there is no answer absent judgment.

Theoretical Depreciation Reserve

The book accumulated provision for depreciation within each function was allocated among Production, Transmission, Distribution, and General Property Plant accounts through the use of the theoretical depreciation reserve model. This study used a reserve model that relied on a prospective concept relating future retirement and accrual patterns for property, given current life and salvage estimates.

The theoretical reserve of a property group is developed from the estimated remaining life of the group, the total life of the group, and estimated net salvage. The theoretical reserve represents the portion of the group cost that would have been accrued if current forecasts were used throughout the life of the group for future depreciation accruals. The computation involves multiplying the vintage balances within the group by the theoretical reserve ratio for each vintage. The straight-line remaining-life theoretical reserve ratio (“RR”) at any given age is calculated as:

$$RR = 1 - \frac{(Average\ Remaining\ Life)}{(Average\ Service\ Life)} * (1 - Net\ Salvage\ Ratio)$$

DETAILED DISCUSSION

Depreciation Study Process

This depreciation study encompassed four distinct phases. The first phase involved data collection and field interviews. The second phase was where the initial data analysis occurred. The third phase was where the information and analysis was evaluated. After the first three stages were complete, the fourth phase began. This phase involved the calculation of depreciation rates and documenting the corresponding recommendations.

During the Phase I data collection process, historical data was compiled from continuing property records and general ledger systems. Data was validated for accuracy by extracting and comparing to multiple financial system sources: Projects System (Construction ledger), Fixed Asset System (continuing property ledger), General Ledger, and interfaces from other operating systems. Audit of this data was validated against historical data from prior periods, historical general ledger sources, and field personnel discussions. This data was reviewed extensively so that it could be put in the proper format for a depreciation study. Further discussion on data review and adjustment is found in the Salvage Consideration section of this study. Also as part of the Phase I data collection process, numerous discussions were conducted with engineers and field operations personnel to obtain information that would be helpful in formulating life and salvage recommendations in this study. One of the most important elements in performing a proper depreciation study is to understand how a company utilizes assets and the environment of those assets. Understanding industry and geographical norms for mortality characteristics are important factors in selecting life and salvage recommendations; however, care must be used not to apply them rigorously to any particular company since no two companies would have the same exact forces of retirement acting upon their assets. Interviews with engineering and operations personnel are important ways to allow the analyst to obtain information that is helpful when evaluating the output from the life and net salvage programs in relation to a company's actual asset utilization and environment. Information that was gleaned in these discussions with SPS personnel for this study is found both in the Detailed

Discussion portions of the Life Analysis and Salvage Analysis sections and also in workpapers. In addition, Alliance personnel possess a significant understanding of the types of electric utility property, the forces of retirement due to years of day-to-day exposures, and operations of electric utility property.

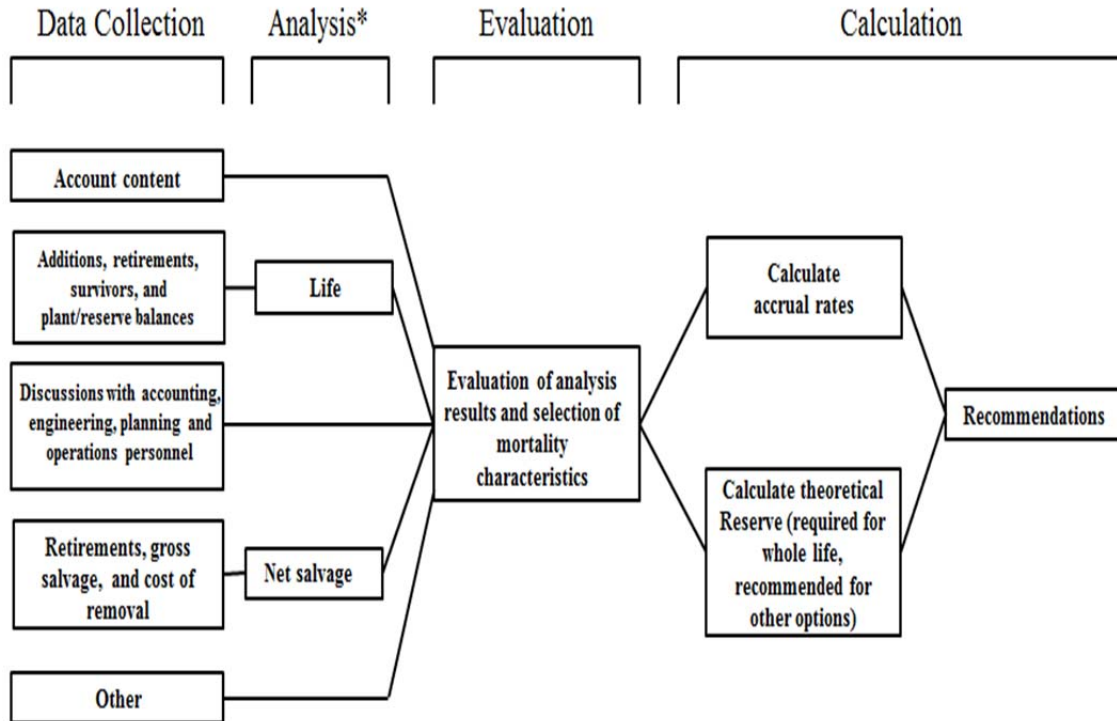

Phase 2 is where the SPR and actuarial analysis are performed. Phase 2 and Phase 3 (to be discussed in the next paragraph) overlap to a significant degree. The detailed property records information is used in Phase 2 to develop observed life tables for life analysis and SPR graphs and statistics. It is possible that an analyst would cycle back to this phase based on the evaluation process performed in Phase 3. Net salvage analysis consists of compiling historical salvage and removal data by functional group and account to determine values and trends in gross salvage and removal cost. This information is then carried forward into Phase 3 for the evaluation process.

Phase 3 is the evaluation process, which synthesizes analysis, interviews, and operational characteristics into a final selection of asset lives and net salvage parameters. The historical analysis from Phase 2 is further enhanced by the incorporation of recent or future changes in the characteristics or operations of assets that were revealed in Phase 1. The preliminary results are then reviewed by the depreciation analyst and discussed with accounting and operations personnel. Phases 2 and 3 allow a depreciation analyst to validate the asset characteristics as seen in the accounting transactions with actual company operational experience.

Finally, Phase 4 involves the calculation of accrual rates, making recommendations and documenting the conclusions in a final report. The calculation of accrual rates for this study is found in Appendix A. Recommendations for the various accounts are contained within the Detailed Discussion of this report. The depreciation study flow diagram shown as Figure 1³ documents the steps used in conducting this study. Depreciation Systems on page 289 documents the same basic processes in performing a depreciation study.

*Although not specifically noted, the mathematical analysis may need some level of input from other sources (for example, to determine analysis bands for life and adjustments to data used in all analysis).

SPS New Mexico Depreciation Study Process

Production Depreciation Calculation Process

Annual depreciation expense amounts for the Steam Production and Other Production accounts were calculated by the straight line, remaining life procedure. In a whole life representation, the annual accrual rate is computed by the following equation,

$$\text{Annual Accrual Rate} = \frac{(100\% - \text{Net Salvage Percent})}{\text{Average Service Life}}$$

In the case of steam production facilities with a terminal life and interim retirement curve, each vintage within the group has a unique average service life and remaining life determined by computing the area under the truncated Iowa Curve coupled with the group's terminal life. Use of the remaining life depreciation system adds a self-correcting mechanism, which accounts for any differences between theoretical and book depreciation reserve over the remaining life of the group. For production assets, the remaining life for each account is derived from the remaining life of the generating unit. With the straight line, remaining life, average life group system, composite remaining lives were calculated by computing a direct weighted average of each remaining life by vintage within the group. Within each group, for each plant account and generating unit, the difference between the surviving investment, adjusted for estimated future net salvage, and the allocated book depreciation reserve, was divided by the composite remaining life to yield the annual depreciation expense as noted in this equation.

$$\text{Annual Depreciation Expense} = \frac{\text{Original Cost} - \text{Book Reserve} - (\text{Original Cost} * \text{Net Salvage \%})}{\text{Remaining Life}}$$

Within a group, the sum of the group annual depreciation expense amounts, as a percentage of the depreciable original cost investment summed, gives the annual depreciation rate as shown below:

$$\text{Annual Depreciation Rate} = \frac{\sum \text{Annual Depreciation Expense}}{\sum \text{Original Cost}}$$

These calculations are shown in Appendix A. The calculations of the theoretical depreciation reserve values and the corresponding remaining life calculations are shown in the workpapers. Book depreciation reserves are maintained on a plant account and generating unit level basis. Theoretical reserve computations were used to reallocate depreciation reserves by account and to compute remaining life for each group. The only generating unit and accounts that were not included in the Steam Production reallocation process were Moore County Accounts 311-316. Moore County was retired in 2013 and thus does not have a remaining life to recover the cost. Therefore the cost of removal for Moore County was fully funded through the Steam Production reserve reallocation process. The only generating units and accounts that were not included in the Other Production reallocation process were Carlsbad, Accounts 311-316, and Blackhawk Pipeline, Account 342. Carlsbad was retired in 2017 and thus does not have a remaining life to recover the cost. Carlsbad remaining reserve balance accounting treatment was not determined in Case 18-00329 UT, Carlsbad Abandonment and therefore excluded from the reserve reallocation. Blackhawk Account 342 had previously been excluded from studies because the asset had been fully depreciated with a zero net book value since the ownership of the pipeline was transferred to SPS. Due to gas pipeline safety legislation, SPS was required to perform extensive and costly safety and integrity work on the pipeline. Computations for the remainder of other production assets mirror those shown above. Steam and Other Production retired generating units Denver City, Riverview and Tucumcari do not have a remaining life and therefore the book reserve was reallocated to produce a zero reserve in these units and accounts.

Transmission, Distribution and General Calculation Process

Annual depreciation expense amounts for Transmission, Distribution, and General Property Accounts 389 - General Land Rights and 390 - General Structures and

Improvements were calculated by the straight line, average life group, remaining life procedure.

In a whole life representation, the annual accrual rate is computed by the following equation,

$$\text{Annual Accrual Rate} = \frac{(100\% - \text{Net Salvage Percent})}{\text{Average Service Life}}$$

Use of the remaining life depreciation system adds a self-correcting mechanism, which accounts for any differences between theoretical and book depreciation reserve over the remaining life of the group. With the straight line, remaining life, average life group system using Iowa Curves, composite remaining lives were calculated according to standard broad group expectancy techniques, noted in the formula below:

$$\text{Composite Remaining Life} = \frac{(\sum \text{Original Cost} - \text{Theoretical Reserve})}{\sum \text{Whole Life Annual Accrual}}$$

For each plant account, the difference between the surviving investment, adjusted for estimated future net salvage, and the allocated book depreciation reserve, was divided by the composite remaining life to yield the annual depreciation expense as noted in this equation.

$$\text{Annual Depreciation Expense} = \frac{\text{Original Cost} - \text{Book Reserve} - (\text{Original Cost} * \text{Net Salvage \%})}{\text{Composite Remaining Life}}$$

Within a group, the sum of the group annual depreciation expense amounts, as a percentage of the depreciable original cost investment summed, gives the annual depreciation rate as shown below:

$$\text{Annual Depreciation Rate} = \frac{\sum \text{Annual Depreciation Expense}}{\sum \text{Original Cost}}$$

These calculations are shown in Appendix A. The calculations of the theoretical

depreciation reserve values and the corresponding remaining life calculations are shown in the workpapers for this study. Book depreciation reserves are maintained on a plant account level basis. Theoretical reserve computations were used to reallocate depreciation reserves by account and to compute remaining life for each account.

Vintage Group Amortization

SPS uses vintage group amortization for assets in Accounts 391-398. Vintage group amortization has been approved in Case Nos. 07-00319-UT and 12-00350-UT. Under vintage group amortization, assets in Accounts 391-398 will be retired when they reach the average service life of the group. SPS has reviewed the life and net salvage parameters for all accounts in this group. In the life analysis and salvage analysis sections, recommended changes to each account describe the depreciation parameters requested for those accounts. The amortization accrual for General Property plant will change to reflect the reserve position of the various accounts and changes in life parameters and net salvage percentages. This allows SPS to continue to record small dollar General Property plant items in without detailed record keeping. The amortization accrual calculations for vintage group amortization are reflected in Appendix A-2.

The changes in General Property plant for Vintage Group Amortization assets resulted in a reserve difference that has to be addressed to provide full recovery of the cost for these assets. The remaining lives for these accounts are all five years or less, which would create a large spike in depreciation accrual rates to recover any general plant reserve deficiency. For those reasons, a 10 year recovery period for the General Property plant reserve deficiency is recommended in this study.

LIFE ANALYSIS

PRODUCTION PLANT

Steam Production, FERC Accounts 311-316

Other Production, FERC Accounts 340-346

SPS has seven Fossil Steam Production generating sites included in this study: Cunningham, Harrington, Jones, Maddox, Nichols, Plant X, and Tolk. Other Production generation sites include Blackhawk, Cunningham, Jones, Maddox, and Quay County. A new generating project is coming on-line in 2019. The new facility will be located in Hale County, TX and will consist of 239 Vestas-Wind Technology turbines. Hale County will be added to plant in service to compute the proposed depreciation rates and parameters presented in this study.

Terminal Retirement Date

The terminal retirement date refers to the year in which a generating unit will be retired from service. The retirement can be for a number of reasons such as the physical end of the generating unit but will generally be driven by economic retirement of the unit. SPS personnel provided their estimated retirement dates for each generating unit. These dates are based on the current plans and investment in the generating units. Retirement dates for generating units can be found in Appendix D. As new investment is committed to these units or decisions made that units are not economically viable, these retirement dates may change. At this time, these retirement dates are the best estimate of the current lives remaining in the generating assets.

Assets located at the Tolk generating station have been separated into groups and those groups have different retirement dates. SPS plans to install synchronous condensers at Tolk to support voltage stability on the system when Tolk is not being used to generate energy. SPS has identified the existing assets at Tolk that will support operation of the synchronous condenser. The generation assets at Tolk will retire in 2032, and assets supporting the synchronous condenser will retire in 2055. No other costs related to the condenser are included in the rates proposed in this depreciation study.

Interim Retirement Curve

Historical data used to develop interim retirement curves represent an aggregate of many property units in a group. Some of those assets may be long lived, and others may have a short life. The average of those is represented by an interim retirement curve for the group. A group can be a plant account or a functional group. The interim retirement curve is “truncated” (*i.e.*, cut off) at the age the unit will retire. In other words, if one finds through the analysis that 10 percent of the property in an account will be retired and replaced prior to the end of the life of the unit, the interim retirement curve will model those retirements across the rest of the life of the unit. If a pump is only going to last 10 years but the unit is projected to last 20 years, the shorter life of the pump should affect the depreciation expense charged over the next 10 years. When analyzing a large pool of assets like power plant accounts, these shorter lived items can be accurately modeled together statistically. Thus, given that interim retirements will occur, this statistical analysis enables one to measure the interim retirement curves applicable to property groups.

Some examples of “long lived” property that are projected to last until the retirement of a unit are: Roads, Bridges, Railroad track, Intake/Discharge Structures, Structural Steel (and misc. steel), Cooling towers, Buildings, Cranes, Dams, Ponds, Basins, Canals, Foundations, Stacking and Reclaiming equipment, Surge Silos, Crushers, Transfer Towers, Fly Ash and Bottom Ash Systems, Precipitators, Bag Houses, Stack, Turbine (except blades) and Piping, Generator Cooling System, Vacuum Systems, Generator and Main Leads, Station Transformers, Conduits and Ducts, Station Grounding System, Start-up Diesel Generators, and Stores Equipment.

Some examples of “shorter lived” property that are projected to retire prior to the retirement of the unit are: fences, signs, sprinkler systems, security systems, Intake screens, roofs, cooling fan units, air compressors, fuel oil heaters, heating, ventilation and air conditioners, piping, motors, pumps, conveyors, pulverizers, air preheaters, economizers, control equipment, feedwater heaters, boiler feedwater pumps, forced draft (FD) and induced draft (ID) fans, scrubbers, continuous emissions monitoring systems (CEM), turbine blades and buckets, turbine plant instruments, condensers,

control equipment, station service switchgear, and universal power supply (UPS) batteries.

SPS has only unaged data available for historical analysis in the steam production and other production functions, prior to 1970. For each generating unit within the group, annual additions, retirements, transfers, and balances were available from 1970 forward. Since the goal of the life analysis was to model retirement activity for non-terminal events, units which were retired were excluded from life analysis. Assets from FERC Accounts 311-316 and 341-346 were analyzed for SPR analysis. Although some CIs were excellent, curves with REI in the excellent range had lives that were not reasonable for use as interim retirement curves for power plant property. For example, curves with excellent REIs had lives in the range of 35-45 years for many of the bands. Curves that were in the more normal range for interim retirement curves had REIs only in the fair range. A further discussion of the selection of interim retirement curves for the electric production accounts 311-346 follows in the Detailed Discussion section.

Steam Production, FERC Accounts 311-316

Interim Retirement Curve Life Analysis

Historical data for all units was combined by account in Accounts 311-316 to analyze historical activity and develop proposed interim retirement curves. This combined experience across various generating units was used as a representation of SPS' retirement history for fossil production to model future retirement activity. Proposed interim retirement lives and dispersion curves to reflect the recognition that some assets at each plant will retire prior to the end of the life of the unit were analyzed at an account level for all generating assets within each account.

Steam Production

FERC Account 311.0 Structures and Improvements (75 R2)

This account consists of buildings, structures, fences, lighting systems, and other related assets at each power plant. Retirement dates for each unit are found in Appendix D. The current balance in this account is \$241 million. Accrual rates approved in Case No. 12-00350-UT established the approved interim retirement curve for this account 75 R2. In the 30, 40, and 50 year bands, the top curve is a R2.5 or L1.5, but the lives found are either too short for an interim retirement curve in this account or the REIs are too low. After reviewing visual matches of various curves and considering the types of assets in this account, this study recommends a 75 R2 dispersion curve for interim retirements. A graph of the actual versus simulated balances is shown below.

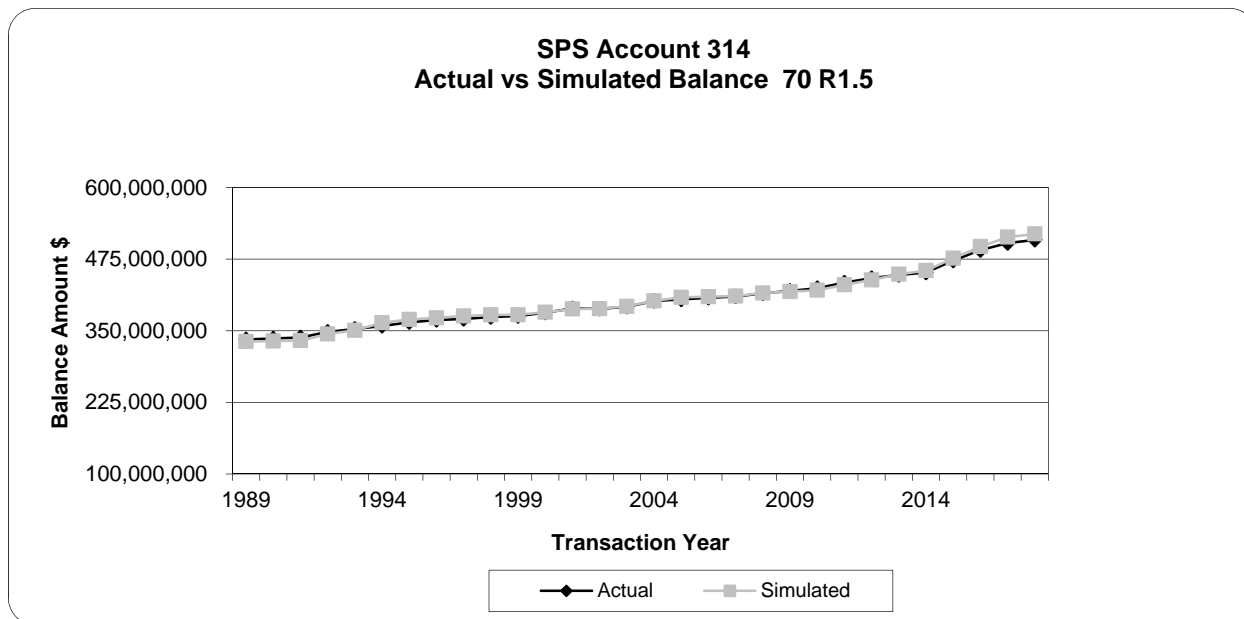

FERC Account 312.0 Boiler Plant Equipment (58 R2)

This account consists of boiler plant equipment, bag houses, preheaters, and other related equipment. Retirement dates for each unit are found in Appendix D. The current balance in this account is \$1.0 billion. Accrual rates approved in Case No. 12-00350-UT established the approved interim retirement curve is 58 R2 for this account. For bands 20 years and longer, the R2.5 curve is the top ranked choice, but the life of 50 years is shorter than many companies across the industry use for this account. In Case No. 12-00350-UT, the results were impacted by a large amount of replacements still to be incurred and, consequently, related retirements, which drove the life down. Since many of those projects are now completed, a 58 year life is a more reasonable and rational life than 50 years indicated by the SPR bands of 20 years and longer, especially when compared to the other accounts in this function. After examining plots of simulated versus actual balances and taking into consideration the types of assets in this account, this study recommends retention of a 58 R2 dispersion curve for interim retirements. A graph of the actual versus simulated balances is shown below.

FERC Account 314.0 Turbogenerator Equipment (70 R1.5)

This account consists of turbogenerator equipment, stationary blades, turbine control systems, and other related assets at each power plant. Retirement dates for each unit are found in Appendix D. The current balance in this account is \$509 million. Accrual rates approved in Case No. 12-00350-UT established the approved interim retirement curve is 70 R1.5 for this account. The top two ranked curves in bands longer than 30 years produce lives show lives of 87 and 75 years which are much longer than those used across the industry. After examining comparison of actual versus simulated balances and considering the characteristics of the assets in the account, this study recommends retention of a 70 R1.5 dispersion curve for this account. A graph of the actual versus simulated balances is shown below.

FERC Account 315.0 Accessory Electric Equipment (67 L2.5)

This account consists of power transformer, regulators, and related assets at each power plant. Retirement dates for each unit are found in Appendix D. The current balance in this account is \$83.9 million. Accrual rates approved in Case No. 12-00350-UT established the approved interim retirement curve is 64 L2.5 for this account. In bands from 20 to 50 years, the 67 L2.5 curve is the top choice. After reviewing plots of actual versus simulated balances and considering the characteristics of the assets in this account, this study recommends a 67 L2.5 dispersion curve. A graph of the actual versus simulated balances is shown below.

FERC Accounts 316.0 Miscellaneous Power Plant Equipment (60 S0)

This account consists of tanks, pumps, work equipment, and other related assets at each power plant. Retirement dates for each unit are found in Appendix D. The current balance in this account is \$32.1 million. Accrual rates approved in Case No. 12-00350-UT established the approved interim retirement curve is 56 S0 for this account. In bands from 30 to 40 years, the 60 S0 curve is one of the top choices. However, that curve type is not as commonly used for interim retirement curves in this account. After reviewing plots of actual versus simulated balances and examining the types of assets in the account, this study recommends a 60 S0 dispersion curve. A graph of the actual versus simulated balances is shown below.

Other Production, FERC Accounts 341-346

Interim Retirement Curve

Historical data for all units was combined by account in Accounts 341-346 to analyze historical activity and develop proposed interim retirement curves. This combined experience across various generating units was used as a representation of SPS's retirement history for Other Production to model future retirement activity. To reflect the recognition that some assets at each plant will retire prior to the end of the life of the unit, proposed interim retirement lives and dispersion curves were analyzed at an account level for all generating assets within each account. Accrual rates from Case No. 12-00350-UT did not incorporate an interim retirement factor in Other Production.

Hale Wind Farm will be added to plant in June 2019. To project the life for Hale Wind Farm, the interim retirement curve proposed for each plant account was combined with a 25 year terminal retirement date to project a composite life for each plant account. Those computations are shown in Appendix A-2.

FERC Account 341.0 Structures and Improvements (75 R2)

This account consists of buildings, structures, fences, lighting systems, and other related assets at each power plant. Retirement dates for each unit are found in Appendix D. The current balance in this account is \$14.4 million. Accrual rates approved in Case No. 12-00350-UT did not use an interim retirement curve for this account. All bands show a life of 20 to 30 years that is much shorter than normally experienced for interim retirements in this account across the utility industry. As a point of reference, PNM's recent Case No. 15-00261-UT approved a 75 R2 interim retirement curve for this account. Based on judgment, this study recommends a 75 R2 dispersion curve. A graph of the actual versus simulated balances is shown below.

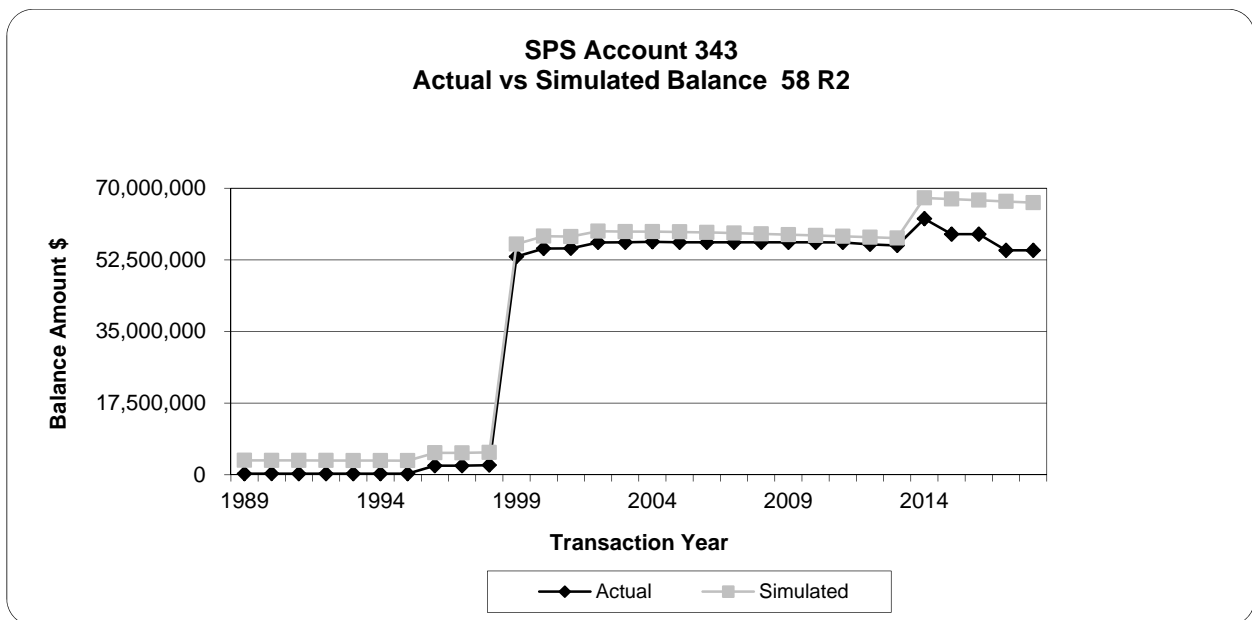

FERC Account 342.0 Fuel Holders and Accessory Equipment (75 R2)

This account consists of pumps, storage tanks, natural gas/fuel oil piping, and other related assets at each power plant. Retirement dates for each unit are found in Appendix D. The current balance in this account is \$6.1 million. Accrual rates approved in Case No. 12-00350-UT did not use an interim retirement curve for this account. All bands show a life that is much shorter than normally experienced for interim retirements in this account across the utility industry. As a point of reference, PNM's recent Case No. 15-00261-UT approved a 60 S6 interim retirement curve for this account. Based on judgment, this study recommends a 75 R2 dispersion curve. A graph of the actual versus simulated balances is shown below.

FERC Account 343.0 Prime Movers (58 R2)

This account consists of foundations, chimneys, demineralizers, fire protection systems, and other related assets at each power plant. Retirement dates for each unit are found in Appendix D. The current balance in this account is \$54.8 million. Accrual rates approved in Case No. 12-00350-UT did not use an interim retirement curve for this account. All bands show a life that is much shorter than normally experienced for interim retirements in this account across the utility industry. Based on judgment, this study recommends a 58 R2 dispersion curve. A graph of the actual versus simulated balances is shown below.

FERC Account 344.0 Generators (70 R1.5)

This account consists of generators and other related assets at each power plant. Retirement dates for each unit are found in Appendix D. The current balance in this account is \$177.4 million. Accrual rates approved in Case No. 12-00350-UT did not use an interim retirement curve for this account. All bands show a life that is much shorter than normally experienced for interim retirements in this account across the utility industry. As a point of reference, PNM's recent Case No. 15-00261-UT approved a 50 S6 interim retirement curve for this account. Based on judgment, this study recommends a 70 R1.5 dispersion curve. A graph of the actual versus simulated balances is shown below.

FERC Account 345.0 Accessory Electric Equipment (67 L2.5)

This account consists of power transformer, regulators and related assets at each power plant. Retirement dates for each unit are found in Appendix D. The current balance in this account is \$31.7 million. Accrual rates approved in Case No. 12-00350-UT did not use an interim retirement curve for this account. All bands show a life that is much shorter than normally experienced for interim retirements in this account across the utility industry. As a point of reference, PNM's recent Case No. 15-00261-UT approved a 31 S2 interim retirement curve for this account. Based on judgment, this study recommends a 67 L2.5 dispersion curve. A graph of the actual versus simulated balances is shown below.

FERC Accounts 346.0 Miscellaneous Power Plant Equipment (60 S0)

This account consists of work equipment, test equipment, pumps, fire protection systems, and other related assets at each power plant. Retirement dates for each unit are found in Appendix D. The current balance in this account is \$4.7 million. Accrual rates approved in Case No. 12-00350-UT did not use an interim retirement curve for this account. All bands show a life that is much shorter than normally experienced for interim retirements in this account across the utility industry. As a point of reference, PNM's recent Case No. 15-00261-UT approved a 35 S6 interim retirement curve for this account. Based on judgment, this study recommends a 60 S0 dispersion curve. A graph of the actual versus simulated balances is shown below.

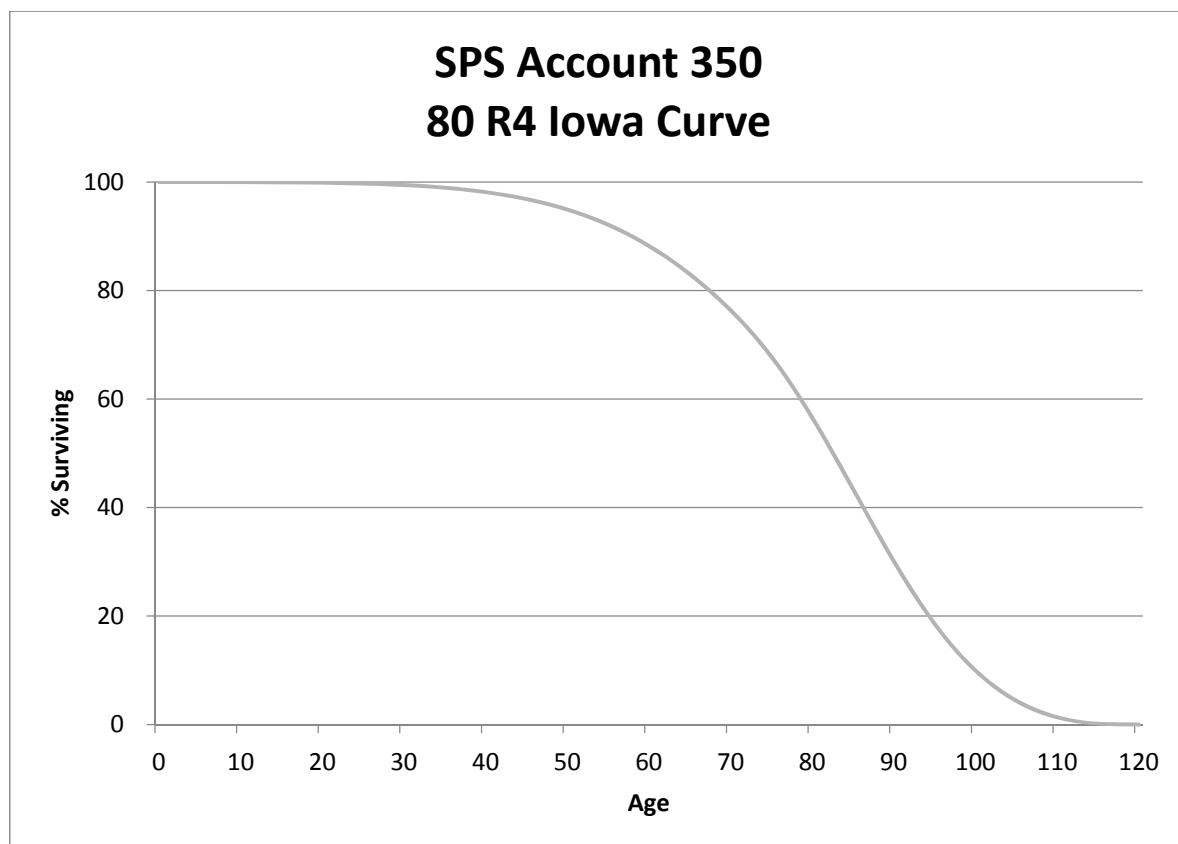

Transmission Accounts, FERC Accounts 350-358

SPS has a wide service territory across Texas and New Mexico. There are significant Transmission assets in substation equipment as well as poles and overhead conductor.

FERC Account 350 Transmission Depreciable Land Rights (80 R4)

This account consists of land rights and easements associated with Transmission lines or Transmission substations. The account balance for this account at December 31, 2018 is \$151.9 million. The rates approved in Case No. 12-00350-UT established a life of 80 years with an R4 dispersion. There is minimal retirement activity in this account, which did not produce sufficient data for an actuarial analysis. The life for depreciable land rights is dependent upon the plant assets that rest on the land rights. The land rights should exhibit a life consistent with the longest life for any Transmission Plant account, which is 75 years. For SPS, this study recommends retaining an 80 year life and an R4 dispersion for this account. A representative curve shape is shown below.

FERC Account 352 Transmission Structures and Improvements (65 R4)

This account includes buildings, fencing, and other structures found in a transmission substation. The account balance for this account at December 31, 2018 is \$101.6 million. The rates approved in Case No. 12-00350-UT established a 65 year life with the R4 dispersion. Limited retirement history⁴ makes actuarial analysis difficult for this account. Although a 65-year life is on the high side of what would be expected in the industry, retention of the 65 year life is recommended with the R4 dispersion for this account.

⁴ Retirement history is 0.80% of the 2018 plant balance.

FERC Account 353 Transmission Substation Equipment (53 R1.5)

This account contains a wide variety of transmission substation equipment, from circuit breakers to switchgear and transformers. The account balance for this account at December 31, 2018 is \$1.1 billion. The rates approved in Case No. 12-00350-UT established a life characteristic of 57 years with an R2.5 dispersion. SPS has an excellent inspection and maintenance program related to substation equipment. This program detects and corrects problems with large substation components in a timely manner to keep equipment in service longer than it would otherwise last without the program. In the past, the program had a tendency to reduce early failures. However, it now appears the indicated life of substation equipment has shortened slightly, which supports Company expectations that the life would shorten due to the amount of replacement, rebuilding, and upgrading that has occurred in the oil fields and around wind generation. In the life analysis there is an excellent match with the 53 R1.5 across the various placement and experience band combinations. This study recommends moving to a 53 year life and changing to the R1.5 dispersion for this account.

FERC Account 354 Transmission Towers and Fixtures (75 R4)

This account consists of Transmission towers, which are used to transmit electricity at a voltage of 69 kV and above. The account balance for this account at December 31, 2018 is \$8.2 million. Most of the Transmission line assets, of which SPS has in excess of 7,700 circuit miles, are in FERC Account 355, Poles and Fixtures, except for 23 circuit miles that are related to tower lines. There are four short tower lines, two in Amarillo one single mile in length and one two mile in length, and two in Lubbock that are each 10 miles in length. The two Amarillo tower lines were built in the 1950s and the 20 miles around Lubbock was built in the 1970s. There is very limited retirement data, the last two retirements occurred in 1989 and 2014. The rates approved in Case No. 12-00350-UT established a life characteristic of 75 years with an R3 dispersion. SPS personnel feel 75 years is appropriate for these assets. Judgment was used to retain the current life of 75 years and move the dispersion to R4.

FERC Account 355 Transmission Poles and Fixtures (51 R2.5)

This account consists of Transmission poles and fixtures, which are used to transmit electricity at a voltage of 69 kV and above. The account balance for this account at December 31, 2018 is \$1.2 billion. The rates approved in Case No. 12-00350-UT established a 51 year life with an R3 dispersion. Review of the actuarial analyses results indicates that the life of transmission poles is decreasing from the prior depreciation study. SPS is using more steel poles than wood poles. A number of lines are entirely made of steel and some are made with wood tangents and steel corners. Double circuit lines are now steel. SPS has in excess of 7,700 circuit miles of transmission line, of which approximately 10% - 15% of the poles are steel. Some wood pole lines are in excess of 50 years old, although many of those poles have been replaced. Some of the oldest steel poles are approaching 40 years of age. SPS has issues with some lines where design and soil conditions are not optimal. A change from white cedar (which lasted longer) to Douglas fir occurred. New growth trees will not last as long as old growth trees and 60% to 65% of existing wood poles are old growth. Many older wood transmission poles of an older design class will not take the weight of reconductoring. Most steel poles were on foundations and now the majority of steel poles are direct buried. Arms are replaced more often than poles. The expectation is that the use of more steel will result in longer service lives for these assets; however, I have recommended a more conservative estimate at this time due to the current mix of assets and continued use of wood poles. Viewing the overall band, a shorter life of 42 years with the R3 dispersion is a good fit, but this is much shorter than the approved life. When viewing more recent placement and experience bands, the life in this account is decreasing slightly and the dispersion is shifting as well. Based on the actuarial analysis of more recent placement and experience bands, as well as feedback from SPS personnel, a 51 year life is retained but a change in dispersion from R3 to R2.5 is recommended for this account.

FERC Account 356 Transmission Overhead Conductor (50 R2)

This account consists of Transmission overhead conductors, which are used to transmit electricity at voltages of 69 kV and above. The account balance for this account at December 31, 2018 is \$446.0 million. The rates approved in Case No. 12-00350-UT established a life of 50 years with the 2.5 dispersion. SPS did not use dampers until the late 1980s. SPS personnel found that wires were not lasting as long without dampers because of shattering at insulators, and even though dampers are now installed on all overhead conductors, they expect to continue seeing residual effects of not using dampers for many years, which results in a shorter service life for the assets still in this account. SPS will replace the wire in many instances when moving from single to double circuit conductor line, and more opportunities are occurring to upgrade lines. SPS would expect a slightly shorter life for conductor than poles. Based on the actuarial analysis, the life indication is moving shorter. Based on more recent experience bands and input from SPS personnel, this study recommends retention of the 50 year life but moving to a slightly flatter R2 dispersion for this account.

FERC Account 357 Transmission Underground Conduit (75 R3)

This account consists of underground conduit used with two underground transmission lines in Amarillo. The account balance for this account at December 31, 2018 is \$273 thousand. There has been little retirement activity⁵ over the study period as shown in Appendix E-2, rendering both actuarial and SPR analysis of no aid in examining the life characteristic. The rates approved in Case No. 12-00350-UT established a life of 75 years with the R3 dispersion through judgment. This study recommends retaining the 75 R3 for this account. A representative curve shape is shown below.

⁵ Retirement history is 0.003% of the 2018 plant balance.

FERC Account 358 Transmission Underground Conductor (45 R3)

This account consists of underground conductor used in two underground transmission lines in Amarillo. The account balance for this account at December 31, 2018 is \$490 thousand. The lines are low pressure, oil filled, paper wrapped 500 MCM copper cable. The rates approved in Case No. 12-00350-UT established a life of 45 years with an R3 dispersion. There has been little retirement activity⁶ over the study period, rendering both actuarial and SPR analysis of no aid in examining life characteristic. This study recommends retaining the 45 R3 for this account. This study recommends retaining the 45 R3 for this account. A representative curve shape is shown below.

⁶ Retirement history is 2.340% of the 2018 plant balance.

FERC Account 359 Roads and Trails (65 R4)

This account consists of roads and trails across the Transmission system. The account balance for this account at December 31, 2018 is \$518 thousand. The rates approved in Case No. 12-00350-UT did not have a life for this account. As a proxy the Company used the life for Account 352, Transmission Structures and Improvements, 65 years, with the R4 dispersion, because this account is expected to have a similar life as Account 359, Roads and Trails. There has been no retirement activity over the study period, rendering both actuarial and SPR analysis of no aid in examining the life characteristic. This study recommends retaining the 65 R4 for this account. This study recommends retaining the 65 R4 for this account. A representative curve shape is shown below.

Distribution Accounts, FERC Accounts 360-373

SPS has a wide service territory across two states. There are significant Distribution assets in substation equipment, poles, overhead conductor, services, line transformers, meters, and street lighting. For mass Distribution accounts, FERC Accounts 364 through 373, only unaged data is available. Life and net salvage for Distribution plant included total company assets. To compute depreciation rates for this study, New Mexico only plant balances and depreciation reserves were used.

FERC Account 360 Distribution Depreciable Land Rights (70 R4)

This account consists of land rights and easements associated with Distribution property or Distribution substations. The total company plant balance for this account at December 31, 2018 is \$9.6 million. The plant balance for this account in New Mexico is \$6.9 million. There was no retirement activity per Appendix E-2, which did not produce sufficient data for an actuarial or SPR analysis. The rates approved in Case No. 12-00350-UT established a life of 60 years with the R4 dispersion. Similar to Account 350, the life for depreciable land rights is dependent upon the plant assets that rest on the land rights. Accordingly, the land rights should exhibit a life consistent with the longest life for any Distribution Plant account, which is 70 years. This study recommends lengthening the life to 70 years with a R4 dispersion for this account. A representative curve shape is shown below.

FERC Account 361 Distribution Structures and Improvements (70 R1.5)

This grouping contains fencing and other structures at a distribution substation. The total company plant balance for this account at December 31, 2018 is \$26.7 million. The plant balance for this account in New Mexico is \$12.3 million. The rates approved in Case No. 12-00350-UT established a life of 55 years with the R1.5 dispersion. There are still some wood structures across the SPS system, but the number remaining is decreasing. New standards are in place and are used for new substations but will also meet new standards on substantial redesign of an existing substation. Based on visual matching and the mix of assets in this account, the study recommends moving to a 70 year life and retaining the R1.5 dispersion for this account.

FERC Account 362 Distribution Substations (55 R1.5)

This grouping contains a wide variety of distribution substation equipment, from circuit breakers to switchgear and transformers. The total company plant balance for this account at December 31, 2018 is \$286.8 million. The plant balance for this account in New Mexico is \$116.6 million. The rates approved in Case No. 12-00350-UT established a life of 55 years with the R1.5 dispersion. SPS personnel estimate the following lives, used for planning purposes, for components in this account: 50 years for transformers; 65 for breakers; 50 for regulators; and 30 years for electromechanical relays. Primary reasons for replacement are: failure, testing indicating elevated risk of failure, capacity increases (especially for circuit breakers), obsolescence, safety hazard related to catastrophic failure mode (and risk is increasing), and proactive replacements of aging assets. Based on visual matching and input from SPS personnel, the 55 R1.5 is retained for this account.

FERC Account 364 Distribution Poles, Towers, and Fixtures (53 R0.5)

This account contains poles and towers of various material types: wood, concrete, and steel. The total company plant balance for this account at December 31, 2018 is \$296.9 million. The plant balance for this account in New Mexico is \$96.3 million. Most of the poles are made of wood but there are a few steel and concrete poles in highly specialized situations. The height ranges from 30 feet to 60 feet with 40 feet and 45 feet are most prevalent. The rates approved in Case No. 12-00350-UT established a life for this account of 52 years with the R0.5 dispersion. SPS has a pole testing program which began in 2007-2008. The goal is to test 10% of SPS’s poles per year. Poles were given the following ratings in the past: P1 (replace within 90 days), P2 (replace within one year), and P3 (replace within 3 years or sleeve/band). However, they have now accelerated replacement of poles by replacing all P1, P2, and P3 poles when inspected, and that higher level is expected to continue. Capital spending has increased due to pole replacements. Accidents, general construction, storms, fires, relocations, and conversions from overhead to underground are all drivers of retirement. After reviewing SPR results and considering input from SPS personnel, this study recommends moving to a 53 year life and retaining the R0.5 dispersion for this account. A plot of the actual versus simulated balances is shown below.

FERC Account 365 Distribution Overhead Conductor (47 R0.5)

This account consists of overhead conductor of various thickness, as well as various switches and reclosers. The total company plant balance for this account at December 31, 2018 is \$271.3 million. The plant balance for this account in New Mexico is \$101.8 million. The rates approved in Case No. 12-00350-UT established a life of 48 years with the R0.5 dispersion. Upgrades, reconductoring, and storms are the largest causes of retirement. Even with the impacts of storms, SPS will replace poles and lift existing conductor back on new poles so that the assets in this account can be reused instead of retired when possible. Some smaller conductor is deteriorating at 35-40 years. Company personnel report that there have been a number of reconductoring projects in recent years that could be affecting the life of conductor. One of the biggest drivers of replacement is the number of splices in the conductor. CIs were low for all except the shortest bands. A low mode dispersion is reflected across all bands. After reviewing SPR results and considering input from SPS personnel, this study recommends moving to a 47 year life and retaining the R0.5 dispersion for this account. A plot of the actual versus simulated balances is shown below.

FERC Account 366 Distribution Underground Conduit (68 R2.5)

This account consists of Distribution conduit, duct banks, vaults, manholes, and ventilating system equipment. The total company plant balance for this account at December 31, 2018 is \$25.3 million. The plant balance for this account in New Mexico is \$6.3 million. The rates approved in Case No. 12-00350-UT established a life for this account of 58 years with the R2.5 dispersion. SPS uses a cable and conduit system. Forces of retirement are age, relocations, and accidents (including dig-ins) at above ground equipment. Generally, SPS will bury assets 55 to 59 inches deep. For underground assets in this account, SPS does not generally splice cable and will always (except in extreme emergency situations) pull new cable when there is a failure or cut. Conduit replacements would be primarily driven by replacing 1 ¼” conduit when such conduit is too small to re-pull cable through. High ranking curves have unacceptable REIs and the lives are outside of a reasonable range for this account. The R2.5 dispersion has a good to excellent REI and a CI in the good range. The various bands show the life increasing to the 67 or 68 year range. This study recommends moving from a 58 year life to a 68 year and retaining the R2.5 dispersion for this account. A plot of the actual versus simulated balances is shown below.

FERC Account 367 Distribution Underground Conductor (53 R1)

This account consists of Distribution conductor, switches, and switchgear. The total company plant balance for this account at December 31, 2018 is \$45.1 million. The plant balance for this account in New Mexico is \$11 million. The rates approved in Case No. 12-00350-UT established a life for this account of 46 years with the R1.5 dispersion. As discussed in Account 366, the primary forces of retirement are age, relocations, and accidents (including dig-ins) at above ground equipment. Sometimes, when upgrading pad mount transformers, SPS may have to replace cable. Conduit replacements would be primarily driven by replacing 1 ¼” conduit when such conduit is too small to re-pull cable through. The R1 dispersion has one of the best rankings with an excellent REI. This study recommends moving to a 53 year life and changing the dispersion slightly from the R1.5 to R1 for this account. A plot of the actual versus simulated balances is shown below.

FERC Account 368 Distribution Line Transformer (46 R1)

This account consists of line transformers, regulators, and capacitors. The total company plant balance for this account at December 31, 2018 is \$218.3 million. The plant balance for this account in New Mexico is \$69.8 million. The rates approved in Case No. 12-00350-UT established a life for this account of 45 years with the R1 dispersion. SPS has a number of live front pad mount transformers, which they will replace with dead front if the transformer is replaced for other reasons. The split between overhead and pad mount transformers is 85% and 15%, respectively. Lightning and heat are big drivers for overhead replacements. Replacements of pad mounts are driven more by growth (capacity needs) or faults, and they also have more rust issues due to their susceptibility to watering and chemicals. These transformers are not repaired but are retired. Company experts expect in time that the life will start shortening due to the less robust quality of the newer transformers and/or if they move away from a run to failure process. SPS personnel expect to see a shorter life than in the past due to the discontinuation of the repair process and the quality of the materials now used. Since these changes are recent and not fully implemented yet, there is no sign in the historical data of a shorter life. Giving consideration to all the information, this study recommends moving the life from the approved 45 years to 46 years and retaining the R1 dispersion for this account. A plot of the actual versus simulated balances is shown below.

FERC Account 369 Distribution Services (48 R1.5)

This account includes all Distribution services, both overhead and underground. The total company plant balance for this account at December 31, 2018 is \$89.0 million. The plant balance for this account in New Mexico is \$28.9 million. The rates approved in Case No. 12-00350-UT established a life for this account of 41 years with the L3 dispersion. Services are split between 40% underground and 60% overhead. Most new services are underground, so the percentage will continue to change over time. Life of overhead services is impacted by vegetation, insulation failure, and load growth. Underground life would be impacted by dig-ins and age of cable. SPS personnel expect the life to be around the same as overhead conductor. The best ranked and fits show a slight increase from the existing life, but this still supports Company expectations. All bands except the very youngest exhibited low CIs. Based on the life analysis and information provided by SPS experts, this study recommends moving to a 48 year life with a R1.5 dispersion for this account. A plot of the actual versus simulated balances is shown below.

FERC Account 370 Distribution Meters (30 R2)

This account includes all Distribution meters. The total company plant balance for this account at December 31, 2018 is \$67.1 million. The plant balance for this account in New Mexico is \$26.1 million. The rates approved in Case No. 12-00350-UT established a life for this account of 40 years with the R2 dispersion. Company experts expect the life of meters to drop because SPS is moving from electromechanical to electronic meters with digital display, also known as digital meters. At present there are between 60% and 65% electromechanical meters, which range in age from 13 to 60 years old. The life of residential digital meters is expected to be shorter than electromechanical meters, with indications as low as 20 years based on manufacturer expectations of battery life. Company experts have seen some digital meters failing at an age under 10 years due to the displays failing. The life of an electromechanical meter is around 40 years or more, absent the forces of technology. SPS has not moved to advanced metering but are moving to digital through attrition. Commercial digital meters follow the same 15-20 year life as residential digital meters. Oil field and irrigation meters were changed to demand meters in 2006-07, with about 12K meters out of a population of over 380K being changed at that time, and another 12K in 2013 due to issues with failing meters in the field. The Company performs random tests of its meters wherein if the old meter is electromechanical, it will replace the old meter with a digital meter. Digital meters will be reused if they pass the testing criteria. In addition, SPS no longer repairs electromechanical meter. It replaces them with digital meters instead. Accordingly, while the majority of meters are still electromechanical, SPS has been installing digital meters for the last 10-15 years and will continue to do so going forward. In addition, Company personnel believe the life of the meter account should be going down.

The historical analysis is not yet reflecting the life of the digital meters. While the REIs are all excellent, the CIs are poor, even in the shorter 30 and 20-year bands. The top ranked curves, in the fuller bands (30 years and longer), are low but have poor CIs. Company personnel recommend a life in the 30-year range as a step toward the future expectations as the Company continues the transition to digital meters. Based on the current asset make-up for this account, with a greater percentage of electromechanical

meters, this study recommends a decrease from a 40 year life to a 30 year life and retaining the R2 dispersion for this account. In the next depreciation study, this account will be reexamined as the move to digital meters continues. A plot of the actual versus simulated balances is shown below.

FERC Account 371 Installation on Customer Premises (Guard Lights) (26 R0.5)

This account consists of guard lights and guard light standards. The total company plant balance for this account at December 31, 2018 is \$0. The plant balance for this account in New Mexico is \$0. The rates approved in Case No. 12-00350-UT established a life for this account of 24 years with the R0.5 dispersion. In 2018 the Company had retired or transferred the majority of assets in this account in error. In June 2019 the retirements and transfers were reversed. Since the historic data is distorted by the large retirement in 2018, no life analysis was relied upon to estimate the life for this account. This Study recommends a very slight increase from 24 to 26 years and retaining the R0.5 dispersion. A representative curve shape is shown below.

FERC Account 373 Distribution Street Lighting (39 R2)

This account includes all Distribution streetlights, conductor, conduit, luminaire, and standards. The total company plant balance for this account at December 31, 2018 is \$30.6 million. The plant balance for this account in New Mexico is \$13.0 million. The rates approved in Case No. 12-00350-UT established a life for this account of 42 years with the R2 dispersion. The Company has an ongoing LED replacement program. All outages are replaced with an LED light. Over the next 6-9 years, they will replace all previous lamp styles with LED. This will accelerate the retirement of the existing heads. Company experts anticipate the LED fixture to last 12-20 years. The overall life of the account is expected to decrease. All CIs in bands longer than the current average service life are poor, so SPR results do not give a good indication of the future. To begin the move towards rates that reflect the technology replacements, this Study recommends a very slight decrease from 42 to 39 years and retaining the R2 dispersion. A plot of the actual versus simulated balances is shown below.

Intangible and General Plant

General Intangible Plant Accounts, FERC Accounts 303

FERC Account 303 Miscellaneous Computer Software – 3 SQ

This account consists of miscellaneous computer software. There is approximately \$2.0 million in this account. Assets in this account include work station operating systems. The approved life of 3 years from Case No. 07-00319-UT should be retained and a dispersion curve of SQ is recommended.

FERC Account 303 Miscellaneous Computer Software – 5 SQ

This account consists of miscellaneous computer software. There is approximately \$101.0 million in this account. Assets in this group include all other base systems. The approved life of 5 years from Case No. 07-00319-UT should be retained and a dispersion curve of SQ is recommended.

FERC Account 303 Miscellaneous Computer Software – 7 SQ

This account consists of miscellaneous computer software. There are currently no assets in this account. Assets in this group might be used to support base systems. This study is recommending a life of 7 years and a dispersion curve of SQ is recommended.

FERC Account 303 Miscellaneous Computer Software – 10 SQ

This account consists of miscellaneous computer software. There is approximately \$7.7 million in this account. Assets in this group include large base computer software systems, such as the billing system. The approved life of 10 years from Case No. 07-00319-UT should be retained and a dispersion curve of SQ is recommended.

FERC Account 303 Miscellaneous Computer Software – 15 SQ

This account consists of miscellaneous computer software. There is approximately \$70.6 million in this account. Assets in this group are large backbone

systems such as the general ledger and Work Asset Management (“WAM”). The approved life of 15 years from Case No. 15-00296-UT should be retained and a dispersion curve of SQ is recommended.

General Property Plant, FERC Accounts 389-398

For general plant accounts 389-390, SPS proposes to continue using actuarial or semi-actuarial analysis. For all other General Property plant accounts (391-398), SPS proposes to continue the use of Accounting Release Number 15 (“AR-15”), which is a vintage year accounting method approved by the FERC, *Vintage Year Accounting For General Plant Accounts*, dated January 1, 1997. AR-15 allowed utilities to use a simplified method of accounting for general plant assets, excluding structures and improvements (referred to as “general plant”). The AR-15 release allowed high volume, low cost assets to be amortized over their associated useful life, eliminated the need to track individual assets, and allowed a retirement to be booked at the end of the depreciable life. This method is often referred to as “amortization of general plant.” The plant asset balances are maintained by vintage installed with the retirement being recorded when book depreciation has been completed. The empirical retirement data for actuarial or semi-actuarial analysis will no longer be reliable, but the determination of useful life can be made appropriately with the use of market forces, manufacturer expected life, technological obsolescence, business planning, known causes of retirement, and changes in expected future utilization.

The depreciation calculation uses a useful life applied to a vintage versus the entire account. The depreciation recovery is complete when the vintage accumulated depreciation is equal to the vintage plant adjusted for estimated salvage and removal costs.

FERC Account 389 General Plant Depreciable Land Rights (60 R4)

This account consists of land rights and easements associated with general property or general structures and improvements. The plant balance for this account at December 31, 2018 is \$46 thousand. The rates approved in Case No. 12-00350-UT established a life of 60 years with the R4 dispersion. In many cases, the lives of individual land rights are tied to the structures that rest on them. Since the proposed life for Account 390, Structures and Improvements, is 60 years, no change in life for this account is recommended. Therefore, retention of a 60 R4 is recommended. A representative curve shape is shown below.

FERC Account 390 General Structures and Improvements (53 R1)

This account consists of general structures and improvements for buildings, including roofing, plumbing, and air conditioning systems. The plant balance for this account at December 31, 2018 is \$68.7 million. The rates approved in Case No. 12-00350-UT established a life of 52 years with the R1 dispersion. Buildings across the SPS system were built at varying times. For example, the building at the Clovis Service Center was built in the 1980s and renovated in 2016. Major installations occurred in the Carlsbad Service Center in 2014 and the Canyon Service Center was in-serviced 2019. The Company plans to renovate approximately every 20 years (*i.e.*, remodel fully within the shell if not renovated for a much longer period - the renovation would be much less if the 20 year cycle is followed) although a number have not been touched for much longer. Although the goal is 20 years, small repairs and replacements (carpet, mechanical equipment, roofs due to weather) allow the cycle may be closer to 30 or 40 years for many buildings based on prior experience. Subject matter experts note that smaller repairs and replacement of items such as carpet mechanical equipment or roofs due to weather allow SPS to push complete renovations to 30 to 40 years. SPS personnel provided estimates of various building components: large generators at 20 to 30 years, small generators at 5-10 years, roofs at 15-20 years, HVAC systems (which would include boilers, cooling towers, chillers, etc.) at 20 years, big chillers at 30 years, parking lots at 15-20 years, UPS and batteries at 5 to 6 years, fire protection life and safety at 10-15 years, and flooring at 15 years. Other retrofit equipment might be overhead doors at a transportation facility or lighting systems. SPS reviews its office assets at each 20 year refresh cycle.

Actuarial analysis shows a 53 year life with the R1 dispersion to be one of the best matches. This study recommends moving to a 53 year life and retaining the R1 dispersion for this account.

GENERAL PLANT AMORTIZED ACCOUNTS

FERC Account 391 Office Furniture and Equipment (20 SQ)

This account consists of miscellaneous office furniture such as desks, chairs, filing cabinets, and tables used for general utility service. There is approximately \$16.6 million in this account, and after retirement of fully accrued assets the plant balance at December 31, 2018 is \$15.8 million. The rates approved in Case No. 12-00350-UT established a life of 25 years with the R2 dispersion. After reviewing the type of assets in this account, this study recommends moving to 20 year life with an SQ dispersion.

FERC Account 391.004 Computer Equipment (5 SQ)

This account consists of network computer equipment used for general utility service. There is approximately \$68.9 million in this account, and after retirement of fully accrued assets the plant balance at December 31, 2018 is \$62.9 million. The rates approved in Case No. 12-00350-UT established a life of 6 years with the R5 dispersion. SPS personnel provided the current replacement cycle used for assets in this account: servers 4 years, storage devices 5 years, printers 6 years, laptop computers 4 years, and desktop computers 5 years. Based on the information provided by Company experts and the current mix of the assets in the account, the study recommends a slight reduction to a life of 5 years with an SQ dispersion.

FERC Account 392.01 Transportation Equipment – Autos (10 SQ)

This account consists of automobiles. There is approximately \$3.3 million in this account at December 31, 2018. However, after AR-15 retirements are made due to assets exceeding their recommended life, the balance in this account will be \$3.2 million. The rates approved in Case No. 12-00350-UT established a life of 14 years with the L2 dispersion. SPS historical life data combines all transportation equipment together until 2014. Thus there is insufficient history to perform life analysis on each sub-account. Information from SPS fleet personnel was used to estimate the life of each sub-account. Historically, they replaced automobiles approximately every 7-10 years. The current financial plan for automobiles is 9 years. However, it will take several years to make that target. SPS Fleet personnel were integral in establishing the

10 SQ recommendation for this account.

FERC Account 392.02 Transportation Equipment – Light Trucks (10 SQ)

This account consists of light trucks. There is approximately \$43.6 million in this account at December 31, 2018. However, after AR-15 retirements are made due to assets exceeding their recommended life, the balance in this account will be \$34.6 million. The rates approved in Case No. 12-00350-UT established a life of 14 years with the L2 dispersion. SPS historical life data combines all transportation equipment together until 2014. Thus there is insufficient history to perform life analysis on each sub-account. Information from SPS fleet personnel was used to estimate the life of each sub-account. There are several different types of vehicles within this group. True light trucks (such as ½ ton pickups) have a 7 year life goal. Small SUVs have a 12 year replacement cycle target, but are not a large component of this account. The larger ¾ ton truck has a 7 year replacement cycle goal. 1 ton trucks (with additional equipment) have an 11 year target. The fleet strategy will take several years to fully implement. All also have a mileage component that can shorten the life somewhat. Information from SPS Fleet personnel was integral in establishing the recommendation for this account. This study recommends the 10 SQ.

FERC Account 392.03 Transportation Equipment - Trailers (15 SQ)

This account consists of trailers. There is approximately \$8.4 million in this account at December 31, 2018. However, after AR-15 retirements are made due to assets exceeding their recommended life, the balance in this account will be \$7.5 million. The rates approved in Case No. 12-00350-UT established a life of 14 years with the L2 dispersion. SPS historical life data combines all transportation equipment together until 2014. Thus there is insufficient history to perform life analysis on each sub-account. Information from SPS fleet personnel was used to estimate the life of each sub-account. The Company plans to replace at 15 years. Information from SPS Fleet personnel was used to establish the recommendation for this account. This study recommends moving to a 15 SQ.

FERC Account 392.04 Transportation Equipment – Heavy Trucks (12 SQ)

This account consists of heavy trucks. There is approximately \$57.2 million in this account at December 31, 2018. However, after AR-15 retirements are made due to assets exceeding their recommended life, the balance in this account will be \$42.6 million. The rates approved in Case No. 12-00350-UT established a life of 14 years with the L2 dispersion. SPS historical life data combines all transportation equipment together until 2014. Thus there is insufficient history to perform life analysis on each sub-account. Information from SPS fleet personnel was used to estimate the life of each sub-account. For planning purposes, the Company is using a 12 to 14 year target based on the type of truck. Digging units are more expensive but not high mileage and are generally retired due to time, although there is a mileage component of 100k miles. Bucket trucks are generally run for around 12 years, but can frequently be retired earlier due to mileage requirement of 180K miles. Information from SPS Fleet personnel was used to establish the recommendation for this account. This study recommends moving to 12 SQ.

FERC Account 393 Stores Equipment (35 SQ)

This account consists of stores equipment used for general utility service. There is approximately \$431 thousand in this account. However, after AR-15 retirements are made due to assets exceeding their recommended life, the balance in this account will be approximately \$364 thousand at December 31, 2018. The rates approved in Case No. 12-00350-UT established a life of 46 years with the R3 dispersion curve. The existing 46 year life is too long, even for the type of assets. To make the life of both New Mexico and Texas jurisdictions the same, this study recommends moving the life to a 35 SQ.

FERC Account 394 Tools, Shop, and Garage Equipment (35 SQ)

This account consists of various items or tools used in shop and garages such as air compressors, grinders, mixers, hoists, and cranes. There is approximately \$44.0 million in this account at December 31, 2018. There are no AR-15 retirements due to assets exceeding their recommended life. The rates approved in Case No. 12-00350-UT established a life of 35 years with an R2.5 dispersion curve. This study recommends retaining the 35 year life with an SQ dispersion.

FERC Account 395 Laboratory Equipment (25 SQ)

This account consists of laboratory equipment used in general utility service. There is approximately \$11.2 million in this account at December 31, 2018. However, after AR-15 retirements are made due to assets exceeding their recommended life, the balance in this account will move to \$7.0 million. The rates approved in Case No. 12-00350-UT established a life of 25 years with the R1 dispersion. This study recommends retention of the 25 year life and moving to the SQ dispersion.

FERC Account 396 Power Operated Equipment (15 SQ)

This account consists of power-operated equipment such as bulldozers, forklifts, pile drivers, and tractors. There is approximately \$14.8 million in this account at December 31, 2018. However, after AR-15 retirements are made due to assets exceeding their recommended life, the balance in this account will be \$12.9 million. The rates approved in Case No. 12-00350-UT established a life of 16 years with the L2 dispersion. Company personnel report that there are broad categories in this account. Some assets are planned for 8 years (skid steer, backyard units, etc.), 10 years (larger tractors, wheel loaders, etc.) and 15 years (fork lifts, etc.). Company personnel recommend shortening the life to 15 years, based on the longest sub-account life projection. This study recommends moving to a 15 year life with an SQ dispersion.

FERC Account 397 Communication Equipment (15 SQ)

This account consists of miscellaneous communication equipment used in general utility service. There is approximately \$118.5 million in this account at

December 31, 2018. However, after AR-15 retirements are made due to assets exceeding their recommended life, the balance in this account will move to \$82.3 million. The rates approved in Case No. 12-00350-UT established a life of 24 years with the L2 dispersion. There are various types of equipment with varying lives in this account. For example, the land mobile radio and microwave towers were recently upgraded to repair any weaknesses in the existing towers, which can last up to 40 years. Land Mobile Radio (“LMR”) is being retired and/or upgraded this year due to technology change, which subject matter experts currently estimate around 15-20 years. Microwave equipment continues to be upgraded, starting in 2004 through the current year. Those upgrades were made to meet company needs such as band width, redundancy, or resilience. Subject Matter experts note that the upgrades do not extend the life of assets, but they provide cost effective private infrastructure. A 20 year life for the electronics is reasonable. Batteries have a 10 year normal life cycle, while back-up generators, switches, etc. may last 15- 20 years. Satellite dishes in remote areas that are a couple years old are being replaced by the vendor. Mobile radios in trucks are expected to last about 20 years. Inside fiber may last 15 years, and service centers at least 20 years. Equipment to “light” fiber is around 15 years. Private Branch Exchange (“PBX”) (Avaya) are primarily Voice Over Internet Protocol (“VOIP”). Proprietary servers are replaced with upgrades at around 7 years. Gateways may last 15-20 years. Company subject matter experts anticipate that assets that are technology-driven are expected to last around 15 years. They note estimated lives for the following assets: load shedding equipment found in the microwave/LMR shelters is being replaced now at 15 years; and Supervisory Control and Data Acquisition (“SCADA”) and electronics are expected to have a 10-15 year life cycle. Subject matter experts note that some risk exists that technology will force even faster replacement. Given the rapid change in technology in this area, a shorter life is reasonable. Based on feedback from SPS subject matter experts, a 15 SQ is recommended.

FERC Account 398 Miscellaneous Equipment (24 SQ)

This account consists of miscellaneous equipment used in general utility service. There is approximately \$2.8 million in this account at December 31, 2018. However,

after AR-15 retirements are made due to assets exceeding their recommended life, the balance in this account will move to \$2.3 million. The rates approved in Case No. 12-00350-UT established a life of 29 years with the R1 dispersion. This account has a mix of assets with varying lives. The existing life is too long for the majority of the assets. This study recommends moving to a 24 year life and an SQ dispersion.

SALVAGE ANALYSIS

When a capital asset is retired, physically removed from service, and finally disposed of, terminal retirement is said to have occurred. The residual value of a terminal retirement is called gross salvage. Net salvage is the difference between the gross salvage (what the asset was sold for) and the removal cost (cost to remove and dispose of the asset).

Gross salvage and cost of removal related to retirements are recorded to the general ledger in the accumulated provision for depreciation at the time retirements occur within the system.

Net salvage data by plant account for Transmission, Distribution, and General Property plant is shown in Appendix E. Removal cost percentages are calculated by dividing the current cost of removal by the original installed cost of the asset. Some plant assets can experience significant negative removal cost percentages due to the timing of the addition versus the retirement. For example, a Transmission asset in FERC Account 355 with a current installed cost of \$500 (2019) would have had an installed cost of \$52.25⁷ in 1964. A removal cost of \$50 for the asset calculated (incorrectly) on current installed cost would only have a negative 10 percent removal cost (\$50/\$500). However, a correct removal cost calculation would show a negative 96 percent removal cost for that asset (\$50/\$52.25). Inflation from the time of installation of the asset until the time of its removal must be taken into account in the calculation of the removal cost percentage because the depreciation rate, which includes the removal cost percentage, will be applied to the original installed cost of assets.

⁷ Using the Handy-Whitman Bulletin No. 188, E-5, line 36, $\$52.25 = \$500 \times 58/555$.

Salvage - Steam Production and Other Production Property

The concept behind the net salvage cost component of depreciation rates for power plants is different from that of Transmission or Distribution assets. Power plants are discrete units that will need to be dismantled after the end of their useful lives. Because of this, instead of statistically analyzing the historical cost for salvaging and removing assets with rolling and shrinking bands, engineering studies are conducted to determine the cost to dismantle the individual units or plants.

The current net salvage rates established in Case No. 12-00350-UT incorporate dismantling costs for SPS facilities from a 2012 Dismantling Study. This depreciation study updates the projected dismantling costs mainly with results from the Production Plant Dismantling Cost Study for SPS that was completed in 2019 by Burns and McDonnell ("Dismantling Cost Study"). The Dismantling Cost Study results are stated in 2018 dollars. The total Steam Production and Other Production removal cost per the Dismantling Cost Study are identified for each plant and unit. Removal costs related to transmission and distribution assets, such as GSU & foundation, transformers & foundations, transformer oil removal, substation, and transmission line were excluded before allocating the removal costs to each FERC Plant Account for the unit. In addition, dismantling costs were obtained for Blackhawk, Carlsbad and Moore County from subject matter experts.

The proposed net salvage rates in total are more negative than the net salvage percent used in the approved depreciation rates established in Case No. 12-00350-UT. The removal cost was divided by the depreciable investment at that plant unit and FERC Account to create a net salvage percentage for that particular plant unit and FERC Account. The demolition cost for each plant was combined with the interim removal cost based on each interim survivor curve for Accounts 311-316 and Accounts 341-346 to model total Steam Production and Other Production removal cost. Based on the Dismantling Cost Study, the composite net salvage percentages for Steam Production and Other Production plant are negative 17 percent and negative 2 percent, respectively, as shown on Appendix H. The total generation net salvage composite is negative 15 percent. The terminal net salvage from the Dismantling Study is negative

13 percent net salvage and the remainder of the composite net salvage is negative 2 percent net salvage which comes from the interim removal cost.

Carlsbad dismantling costs are not incorporated in the reserve reallocation process and the Company is seeking regulatory asset treatment for those costs. The Carlsbad remaining reserve balance accounting treatment was not determined in Recommended Decision, Case 18-00329 UT, Carlsbad Abandonment and therefore excluded from the reserve reallocation.

The allocated dismantling costs by generating unit and account shown on Appendix G are then combined with interim net salvage to develop average net salvage percentages as shown in Appendix H. Generating units with a retirement date in 2019 used an interim net salvage rate of zero, as interim retirements were not estimated in the last year of life because the assets will be fully depreciated at the end of life in 2019. The interim net salvage history for each plant account is shown in Appendix E-1. Moore County dismantling costs were fully funded through the reserve reallocation for Steam Production as shown in Appendix F and G.

For Hale Wind Farm, the net salvage percentage was computed by incorporating the Dismantling Cost Study removal cost plus interim retirements and removal costs estimated in Account 344. Accounting entries for this plant indicate that most of the assets for Hale will be booked in Account 344. The computation for Hale Wind Farm composite net salvage is shown in Appendix H and used to compute the proposed depreciation accrual rate in Appendix A-2.

Interim Net Salvage, FERC Accounts 311-316

FERC Account 311.0 Structures and Improvements (Negative 15 percent)

This account consists of any gross salvage or removal cost associated with buildings, structures, fences, lighting systems, and other related assets at each power plant. Accrual rates approved in Case No. 12-00350-UT established the approved interim net salvage rate for this account is negative 18 percent. Appendix E-1 shows the most recent five and ten year bands show a net salvage percentage of -49.87 and -

44.49 percent respectively. Based on history and judgment, this study recommends negative 15 percent for interim net salvage for this account.

FERC Account 312.0 Boiler Plant Equipment (Negative 15 percent)

This account consists of any gross salvage or removal cost associated with boiler plant equipment, bag houses, preheaters, and other related equipment. Accrual rates approved in Case No. 12-00350-UT established the approved interim net salvage rate for this account is negative 17 percent. Appendix E-1 shows the most recent five and ten year bands show a net salvage percentage of -28.79 and -33.44 percent respectively. Based on history and judgment, this study recommends negative 15 percent for interim net salvage for this account.

FERC Account 314.0 Turbogenerator Equipment (Negative 15 percent)

This account consists of any gross salvage or removal cost associated with turbogenerator equipment, stationary blades, turbine control systems, and other related assets at each power plant. Accrual rates approved in Case No. 12-00350-UT established the interim net salvage rate for this account is negative 16 percent. Appendix E-1 shows the most recent five and ten year bands show a net salvage percentage of -41.44 and -45.65 percent respectively. Based on history and judgment, this study recommends negative 15 percent for interim net salvage for this account.

FERC Account 315.0 Accessory Electric Equipment (Negative 15 percent)

This account consists of gross salvage or removal cost associated with power transformer, regulators, and related assets at each power plant. Accrual rates approved in Case No. 12-00350-UT established the approved interim net salvage rate for this account is negative 12 percent. Appendix E-1 shows the most recent five and ten year bands show a net salvage percentage of -26.82 and -43.27 percent respectively. Based on history and judgment, this study recommends negative 15 percent for interim net salvage for this account.

FERC Accounts 316.0 Miscellaneous Power Plant Equipment (Negative 5 percent)

This account consists of any gross salvage or removal cost associated with tanks, pumps, work equipment, and other related assets at each power plant. Accrual rates approved in Case No. 12-00350-UT established the approved interim net salvage rate for this account is negative 4 percent. Appendix E-1 shows the most recent five and ten year bands show a net salvage percentage of -16.84 and -24.34 percent respectively. Based on history and judgment, this study recommends negative 5 percent for interim net salvage for this account.

Interim Net Salvage, FERC Accounts 340-346

FERC Account 341.0 Structures and Improvements (Negative 5 percent)

This account consists of any gross salvage or removal cost associated with buildings, structures, fences, lighting systems, and other related assets at each power plant. Case No. 12-00350-UT established no approved interim net salvage rate for this account. Appendix E-1 shows the most recent five and ten year bands show a net salvage percentage of -0.40 and -4.77 percent respectively. Based on history and judgment, this study recommends negative 5 percent for interim net salvage for this account.

FERC Account 342.0 Fuel Holders and Accessory Equipment (Negative 5 percent)

This account consists of any gross salvage or removal cost associated with pumps, storage tanks, natural gas/fuel oil piping, and other related assets at each power plant. Case No. 12-00350-UT established no approved interim net salvage rate for this account. Appendix E-1 shows the most recent five and ten year bands show a net salvage percentage of -38.78 and -23.53 percent respectively. Based on history and judgment, this study recommends negative 5 percent for interim net salvage for this account.

FERC Account 343.0 Prime Movers (Negative 3 percent)

This account consists of any gross salvage or removal cost associated with foundations, chimneys, demineralizers, fire protection systems and other related assets at each power plant. Case No. 12-00350-UT established no approved interim net salvage rate for this account. Appendix E-1 shows the most recent five and ten year bands show a net salvage percentage of -3.86 and -3.83 percent respectively. Based on history and judgment, this study recommends negative 3 percent for interim net salvage for this account.

FERC Account 344.0 Generators (Negative 3 percent)

This account consists of any gross salvage or removal cost associated with generators and other related assets at each power plant. Case No. 12-00350-UT

established no approved interim net salvage rate for this account. Appendix E-1 shows the most recent five and ten year bands show a net salvage percentage of -15.81 and -4.23 percent respectively. Based on history and judgment, this study recommends negative 3 percent for interim net salvage for this account.

FERC Account 345.0 Accessory Electric Equipment (Negative 5 percent)

This account consists of any gross salvage or removal cost associated with power transformer, regulators, and related assets at each power plant. Case No. 12-00350-UT established no approved interim net salvage rate for this account. Appendix E-1 shows the most recent five and ten year bands show a net salvage percentage of -384.69 and -7.35 percent respectively. Based on history and judgment, this study recommends negative 5 percent for interim net salvage for this account.

FERC Accounts 346.0 Miscellaneous Power Plant Equipment (Negative 5 percent)

This account consists of any gross salvage or removal cost associated with work equipment, test equipment, pumps, fire protection systems, and other related assets at each power plant. Case No. 12-00350-UT established no approved interim net salvage rate for this account. Appendix E-1 shows the most recent five and ten year bands show a net salvage percentage of 0.00 and -0.41 percent respectively. Normally these assets generate some removal cost. Based on judgment, this study recommends negative 5 percent for interim net salvage for this account.

Salvage - Transmission Property

Increasing levels of removal cost are experienced in nearly all accounts in this function. Moving averages, which smooth out yearly fluctuations between retirements and net salvage, are used to examine data over the 1968 to 2018 period (or newer depending on the account) and determine net salvage estimates for each account. Detailed analysis and results by account are shown in Appendix E-2 and individual account results are discussed below.

The cost of retirement and removal of transmission assets has increased over the last several years. Company personnel have provided the following to help explain some of the pressures that are increasing the cost to remove transmission assets from service:

- Time Value of Money

SPS's transmission assets have lives ranging from 45 to 80 years as proposed in Appendix C-2. When assets are retired and removed, the removal costs are valued in today's dollars. However the retired assets were constructed when materials, labor, and cost of goods were cheaper. The average age of retirements for transmission assets in the Company's historical data is approximately 20 years. Accordingly, there is a difference in the value of the old assets compared to the cost to remove them, which results in higher net salvage rates in recent years.

- Environmental Regulations and Right-of-Way Access/Use Restrictions

The cost of demolition has increased due to increased regulation and restrictions on environmental impact, mitigation, and restoration measures. The equipment, labor, and other expenses will also increase with facilities located in hard to access locations. Also, many construction or demolition permits now require the restoration of vegetation to a natural state that spans several growing seasons to restore.

SPS is also experiencing increasing Right-of-way ("ROW") access restrictions from landowners and the Bureau of Land Management ("BLM") in its New Mexico service territory. The New Mexico service territory includes significant area managed by the BLM, which imposes more governmental

oversight, increasing costs for both construction and removal. Also, growth in the western portion of the framed Permian Basin in Texas and New Mexico is in the heart of what may be the nation's richest oil and gas production in the coming years. This activity in the Permian Basin has increased significantly since 2013 and is expected to continue for the next 20-30 years, thus requiring additional activities and costs to access right of way.

Environmental protections also affect the salvage value of material. Wood poles that were once sold for a positive salvage value now must be disposed of due to the presence of creosote, the wood protectant material, which entail significant costs as well.

- Change in NERC and FERC requirements

The 10.07.10 NERC Alert issued October 7, 2010 and on November 30, 2010 required utilities to verify that facility ratings were based on actual field conditions. Xcel Energy used LiDar studies to identify and fix clearance issues to meet the requirements of this NERC Alert. For example, Xcel Energy recently conducted LiDar studies on its transmission lines to determine if the lines comply with clearance requirements and to replace transmission assets that violate clearance standards issued by NERC.

- Labor

Due to increased regulation on operating standards, taking equipment out of service for removal and construction of assets has become more difficult, requiring more projects to be performed while the lines are still energized or forcing constructions to occur in the evening, or on weekends, both of which require overtime of crews. Overall cost of labor has also increased since the assets were installed. Not only have wages increased for journey and apprentices in recent years, but the demand for the resources has increased due to a shortage of licensed workers and more competition for their services. The shortage has placed a positive price pressure for labor costs. In the last decade, investment in the transmission system has increased substantially across the country. This has created a high demand for the limited number of qualified resources available to construct the work. The increases in capital projects are

such that utilities now have to augment their internal workforces with external contract construction providers, who often come at a higher cost.

- Safety Requirements

The electric utility industry, in general, and Xcel Energy in particular, has emphasized the importance of employees complying with safe working practices. SPS personnel indicated that the equipment and provisions required today have increased substantially from 40 years ago. Although these are an important part of the safety culture for Xcel Energy, the policies have increased the cost of doing business.

- Salvage Value

Many of the assets that are removed do not carry a high salvage value. Some of the assets may be sold as scrap, but the proceeds do not amount to the cost of installation or fully offset the removal costs. Assets that can be reused are placed into inventory instead of sold. In several cases, the assets being removed are of wood construction, in which case there is no salvage value. Gross salvage received has declined compared to proceeds received in the 1970s and 1980s.

- Asset Renewal

Utilities across the nation are now dealing with an antiquated, aging transmission infrastructure. It is necessary for utilities to have pro-active asset renewal programs to replace transmission assets before they fail. The frequency of projects requiring removal of existing assets has increased substantially over the last decade due to the aging infrastructure and will continue to increase into the future, and this is true as well of SPS's system.

FERC Account 350 Transmission Depreciable Land Rights (0 percent)

The currently approved net salvage estimate for this account is 0 percent. Retirement activity has been very limited in this account. Since land rights intrinsically have no removal costs (removal costs are attributed to the chattel property on the land) and have no salvage value, a 0 percent net salvage was assigned to this account.

FERC Account 352 Transmission Substation Structures and Improvements (Negative 20 percent)

The currently approved net salvage estimate for this account is negative 20 percent. In the 2018 transaction year, -59.94 and -53.47 percent exist for the five-year and 10-year bands, respectively. There has been an increase in removal cost reflected in this account for the last several years. Based on history and judgment, this study recommends retaining a net salvage estimate of negative 20 percent for this account until more information is available.

FERC Account 353 Transmission Station Equipment (Negative 20 percent)

The currently approved net salvage estimate for this account is negative 19 percent. In the most recent period, a moving average of -24.29 percent exists for the five-year band and a -24.01 percent exists for the 10-year band. The most recent years are fairly consistent and more indicative of future net salvage expectations. Therefore, this study recommends a move to a negative 20 percent for this account.

FERC Account 354 Transmission Tower and Fixtures (Negative 5 percent)

The currently approved net salvage estimate for this account is negative 5 percent. Given the small level of retirements and net salvage transactional data, this study recommends no change and reflecting a small amount of removal cost with a negative 5 percent net salvage estimate for this account.

FERC Account 355 Transmission Poles and Fixtures (Negative 75 percent)

The currently approved net salvage estimate for this account is negative 60

percent. In the most recent period, a moving average of -180.53 and -247.12 percent exists for the five-year and 10-year bands, respectively. Throughout much of the history, a negative 60 percent or greater has been experienced in this account. There is a significant level of retirements from which to create this conclusion. This study recommends a move to a negative 75 percent for this account.

FERC Account 356 Transmission Overhead Conductor (Negative 45 percent)

The currently approved net salvage estimate for this account is negative 30 percent. In the most recent period, a moving average of -205.19 and -145.74 percent exists for the five-year and 10-year bands, respectively. The last five to 10 years is a shows higher negative net salvage for this account. This study recommends moving to negative 45 percent net salvage estimate for this account.

FERC Account 357 Transmission Underground Conduit (0 percent)

The current approved net salvage estimate for this account is zero percent. There has been only one year, 2012, with retirements recorded during the study period. While this single year indicates cost of removal will exceed any salvage, there is not enough data to change the existing zero percent net salvage estimate at this time, so the existing zero percent is retained.

FERC Account 358 Transmission Underground Conductor and Devices (0 percent)

The current approved net salvage estimate for this account is zero percent. There have been only two years, 2011 and 2012, with retirements recorded during the study period. While these years indicate cost of removal will exceed any salvage, there is not enough data to change from the existing zero percent net salvage percent. This study recommends retention of the zero percent net salvage for this account.

FERC Account 359 Roads and Trails (0 percent)

This account consists of roads and trails across the Transmission system. As a proxy the Company used the net salvage percentage for Account 352, which was

negative 20 percent. There has been no retirement activity since this account was created. Based on judgment, this study recommends moving to zero percent net salvage for this account.

Salvage – Distribution Property

Increasing levels of removal cost are experienced in most accounts in this function. The salvage received for retired assets has decreased over that time while the removal cost of assets has increased dramatically. Detailed analysis and results by account are shown in Appendix E-2 and individual account results are discussed below. Just as transmission assets faced increased removal cost, distribution assets are subject to the same cost pressures that are increasing removal cost. See the discussion of Transmission Net Salvage in this study.

FERC Account 360 Distribution Depreciable Land Rights (0 percent)

The currently approved net salvage estimate for this account is zero percent. Retirement activity has been very limited in this account. Since land rights intrinsically have no removal costs (removal costs are attributed to the chattel property on the land) and have no salvage value, a zero percent net salvage estimate is retained for this account.

FERC Account 361 Distribution Substation Structures and Improvements (Negative 10 percent)

The current approved net salvage estimate for this account is negative 15 percent. In the most recent period, a moving average of -257.14 and -123.19 percent exists for the five-year and 10-year bands, respectively. Based on the transactional history, a negative 10 percent net salvage is indicated for numerous years but has started to show some change. At this time, a proposed net salvage estimate of negative 10 percent is supported and recommended for Account 361. As with all accounts, this account will be reviewed in the next depreciation study.

FERC Account 362 Distribution Substation Equipment (Negative 25 percent)

The current approved net salvage estimate for this account is negative 15 percent. In the most recent period, a moving average of -50.43 percent and -33.38 percent respectively for the five-year and 10-year bands. After examining SPS history, this study recommends moving to negative 25 percent net salvage estimate.

FERC Account 364 Distribution Poles, Towers, and Fixtures (Negative 75 percent)

The current approved net salvage estimate for this account is negative 40 percent. In the most recent period, a moving average of -191.20 percent and -147.29 percent exists for the five-year and 10-year bands, respectively. Although other utilities have approved levels of negative net salvage in that range, such a significant change would cause a drastic increase in SPS' depreciation expense for this account. To conservatively treat net salvage, moving to negative 75 percent net salvage estimate is recommended.

FERC Account 365 Distribution Overhead Conductor and Devices (Negative 50 percent)

The current approved net salvage estimate for this account is negative 30 percent. In the most recent period, a moving average of -67.48 and -58.76 percent exists for the five-year and 10-year bands, respectively. A negative 50 percent net salvage estimate is recommended which models SPS's recent and long-term experience.

FERC Account 366 Distribution Underground Conduit (Negative 20 percent)

The current approved net salvage estimate for this account is negative 10 percent. This account has demonstrated erratic levels of net salvage. In the most recent period, a moving average of -124.23 and -117.11 percent exists for the five-year and 10-year bands, respectively. To model net salvage in the future, a negative 20 percent net salvage estimate is retained for this account at this time.

FERC Account 367 Distribution Underground Conductor and Devices (Negative 30 percent)

The currently approved net salvage estimate for this account is negative 10 percent. This account has demonstrated erratic levels of net salvage. In the most recent period, a moving average of -75.02 percent and -54.69 percent exists for the five-year and 10-year bands, respectively. To model net salvage toward the indications, a negative 30 percent estimate is recommended for this account.

FERC Account 368 Distribution Line Transformers (Negative 10 percent)

The currently approved net salvage estimate for this account is negative 5 percent. In the most recent period, a moving average of -2.89 and -9.84 percent exists for the five-year and 10-year bands, respectively. We recommend a negative 10 percent net salvage estimate for this account at this time.

FERC Account 369 Distribution Services (Negative 40 percent)

The currently approved net salvage estimate for this account is negative 40 percent. In the most recent period, a moving average of -61.13 percent and -58.52 percent exists for the five-year and 10-year bands, respectively. A negative 40 percent net salvage estimate is retained for this account.

FERC Account 370 Distribution Meters (Negative 10 percent)

The currently approved net salvage estimate for this account is negative 10 percent. In the most recent period, a moving average of -0.87 and -8.47 percent exists for the five-year and 10-year bands, respectively. To model net salvage in the future, retention of the existing negative 10 percent net salvage estimate is recommended for this account.

FERC Account 371 Installation on Customer Premises (Guard Lights) (Negative 15 percent)

The currently approved net salvage estimate for this account is negative 15 percent. In 2018, the Company had retired or transferred the majority of assets in this account in error. In June 2019 the retirements and transfers were reversed. In the most recent period, a moving average of -22.56 and -42.74 percent exists for the five-year and 10-year bands, respectively. We recommend a negative 15 percent net salvage estimate for this account at this time.

FERC Account 373 Distribution Street Lighting (Negative 60 percent)

The currently approved net salvage estimate for this account is negative 30

percent. Transactional history shows diminishing positive salvage for this account, with a sharp increase in removal cost since 2004. In the most recent period, a moving average of -95.59 percent and -84.04 percent exists for the five-year and 10-year intervals, respectively. Based on history and judgement we recommend moving to negative 60 percent net salvage estimate for this account at this time.

Salvage – General Property

Accounts in the general function currently have a zero percent net salvage value. For General Property plant Accounts 391-398, SPS will continue the use of AR-15 using the study-recommended net salvage parameters. Detailed analysis and results by account are shown in Appendix E-3 and individual account results are discussed below.

FERC Account 389 Land Rights (0 percent)

The currently approved net salvage estimate for this account is zero percent. Land rights generally have no salvage value at retirement and none is shown in the analysis. A zero percent net salvage estimate is recommended to be retained for this account.

FERC Account 390 Structures and Improvements (Negative 10 percent)

The currently approved net salvage estimate for this account is 0 percent. This account consists of all General Property structures, which may range from buildings to building components such as HVAC systems or roofs. In 2003, a consolidation of facilities occurred which produced a large positive salvage. This is a one-time event related to merger activity and SPS cost reduction initiatives. This is not anticipated to recur. The most recent five and 10 year moving average show -5.65 and -12.17 percent net salvage, respectively. This study recommends moving toward the negative net salvage indications, but limiting it to a negative 10 percent net salvage estimate for this account at this time.

FERC Account 391 Office Furniture and Equipment (0 percent)

This account consists of gross salvage and cost of removal for miscellaneous office furniture such as desks, chairs, filing cabinets, and tables used for general utility service. The currently approved net salvage estimate for this account is zero percent. The average net salvage has been declining for the last several years. The most recent five and 10 year moving averages show -0.27 and -0.68 percent respectively. To model net salvage in the future, a zero percent net salvage estimate is recommended for this

account.

FERC Account 391.004 Computer Equipment (0 percent)

This account consists of gross salvage and cost of removal for network computer equipment used for general utility service. The currently approved net salvage estimate for this account is zero percent. Activity is only recorded since 2006 with some indication that some salvage and cost of removal are possible. Overall indications are negligible. Therefore, retaining a zero percent net salvage estimate is requested for this account.

FERC Account 392.01 Transportation Equipment - Autos (10 percent)

The currently approved net salvage estimate for this account is zero percent. For the period 2006 to 2013, SPS recorded proceeds against the cost of a new asset as a part of a like kind exchange program. In 2014, SPS discontinued the like kind exchange program and sold used transportation equipment. To obtain data indicating the net salvage by subaccount, SPS Fleet personnel assisted in providing subaccount level retirement and net salvage information. SPS Fleet personnel provided reports comparing the original cost of the assets sold in the last five years to the net salvage this class of property generated. Those results are found in Appendix E-4 and show positive 10 to 11 percent for this account. Based on the information provided by Fleet personnel and judgment, this study recommends moving to a positive 10 percent net salvage estimate for this account.

FERC Account 392.02 Transportation Equipment - Light Trucks (12 percent)

The currently approved net salvage estimate for this account is zero percent. For the period 2006 to 2013 SPS' recorded proceeds against the cost of a new asset as part of a like kind exchange program. In 2014, SPS discontinued the like kind exchange program and sold used transportation equipment. To obtain data indicating the net salvage by subaccount, SPS Fleet personnel assisted in providing subaccount level retirement and net salvage information. SPS Fleet personnel provided reports comparing the original cost of the assets sold in the last five years to the net salvage

this class of property generated. Those results are found in Appendix E-4 and show positive 12 percent for this account. Based on the information provided by Fleet personnel and judgment, this study recommends moving to a positive 12 percent net salvage estimate for this account.

FERC Account 392.03 Transportation Equipment - Trailers (11 percent)

The currently approved net salvage estimate for this account is zero percent. For the period 2006 to 2013, SPS recorded proceeds against the cost of a new asset as part of a like kind exchange program. In 2014, SPS discontinued the like kind exchange program and sold used transportation equipment. To obtain data indicating the net salvage by subaccount, SPS Fleet personnel assisted in providing subaccount level retirement and net salvage information. SPS Fleet personnel provided reports comparing the original cost of the assets sold in the last five years to the net salvage this class of property generated. Those results are found in Appendix E-4 and show positive 11 percent for this account. Based on the information provided by Fleet personnel and judgment, this study recommends moving to a positive 11 percent net salvage estimate for this account.

FERC Account 392.04 Transportation Equipment – Heavy Trucks (11 percent)

The currently approved net salvage estimate for this account is zero percent. For the period 2006 to 2013, SPS recorded proceeds against the cost of a new asset as part of a like kind exchange program. In 2014, SPS discontinued the like kind exchange program and sold used transportation. To obtain data indicating the net salvage by subaccount, SPS Fleet personnel assisted in providing subaccount level retirement and net salvage information. SPS Fleet personnel provided reports comparing the original cost of the assets sold in the last five years to the net salvage this class of property generated. Those results are found in Appendix E-4 and show positive 11 percent for this account. Based on the information provided by Fleet personnel and judgment, this study recommends moving to a positive 11 percent net salvage estimate for this account.

FERC Account 393 Stores Equipment (0 percent)

This account consists of gross salvage and cost of removal for stores equipment used for general utility service. The currently approved net salvage estimate for this account is zero percent. This kind of equipment seldom produces any gross salvage. To model net salvage in the future, a zero percent net salvage estimate is retained for this account.

FERC Account 394 Tools, Shop, and Garage Equipment (0 percent)

This account consists of gross salvage and cost of removal for various items or tools used in shop and garages such as air compressors, grinders, mixers, hoists, and cranes. The currently approved net salvage estimate for this account is zero percent. A small amount of removal cost has occurred, with the net salvage percentages showing -7.51 and -6.85 in the most recent year for the five and 10 year bands respectively. To model net salvage in the future, a zero percent net salvage estimate is retained.

FERC Account 395 Laboratory Equipment (0 percent)

This account consists of gross salvage and cost of removal for laboratory equipment used in general utility service. The currently approved net salvage estimate for this account is zero percent. The most recent five-year and 10-year net salvage percentages are zero percent for both bands. To model net salvage in the future, a zero percent net salvage estimate is retained for this account.

FERC Account 396 Power Operated Equipment (25 percent)

The currently approved net salvage estimate for this account is zero percent. For the period 2006 to 2013, SPS recorded proceeds against the cost of a new asset as part of a like kind exchange program. In 2014, SPS discontinued the like kind exchange program and sold used power operated equipment. SPS Fleet personnel provided reports comparing the original cost of the assets sold in the last five years to the net salvage this class of property generated. Those results are found in Appendix E-4 and show positive 25 percent for this account. Based on the information provided by Fleet personnel and judgment, this study recommends moving to a positive 25 percent net

salvage estimate for this account.

FERC Account 397 Communication Equipment (0 percent)

This account consists of gross salvage and cost of removal for miscellaneous communication equipment used in general utility service such as radios or microwave equipment. The currently approved net salvage estimate for this account is zero percent. Some removal cost has been experienced in this account in recent years, showing slightly negative net salvage. Expectations are that salvage and cost of removal will offset each other. To model net salvage in the future, a zero percent net salvage estimate is recommended for this account.

FERC Account 398 Miscellaneous Equipment (0 percent)

This account consists of gross salvage and cost of removal for miscellaneous equipment used in general utility service. The currently approved net salvage estimate for this account is zero percent. In the most recent period, a moving average of -2.4 percent and -2.25 percent exists for the five-year and 10-year bands, respectively. Expectations are that salvage and cost of removal will offset each other. To model net salvage in the future, a zero percent net salvage estimate is retained for this account.

Note:
(A) There is currently no balance in these accounts. In the event plant is added to these accounts, SPS requests authorization to use the depreciation rate listed, which represent the composite depreciation rate for each unit.
(B) There is currently no balance in this account. When plant is recorded to this account, SPS requests authorization to use the depreciation rate listed, which represents the whole life rate.

Notes:
(A) Approved rates from Case No. 12-00350-UT, in the Recommended Decision, unless noted otherwise. Quay County was not given express approval for a net salvage percent, therefore zero has been used.
(B) Assets amortized over the lease term.
(C) SPS owns the Blackhawk pipeline, but does not own the Blackhawk plant. SPS has a purchase power agreement for power from the Blackhawk plant. Approved rates from Case No. 15-00296 UT in Certification of Stipulation.
(D) Account 359 approved rates from Case No. 12-00350-UT, in the Recommended Decision based on account 352.
(E) Approved rates from Case No. 15-00296 UT in Certification of Stipulation.
(F) Plant X Unit 1, account 316, approved rates from Case No. 12-00350-UT, in the Recommended Decision based on composite depreciation rate of Plant X Unit 1, accounts 311-315.
(G) Talk Common, account 315, approved rates from Case No. 12-00350-UT, in the Recommended Decision based on composite depreciation rate of Talk Common Facilities accounts 310-314 and 316.
(H) Maddox, account 343, approved rates from Case No. 12-00350-UT, in the Recommended Decision based on composite depreciation rate of Maddox, accounts 341-346, excluding 343.
(I) There is currently no balance in this account. When plant is recorded to this account, SPS requests authorization to use the depreciation rate listed, which represents the whole life rate.

Notes:
 (A) Approved life and net salvage from Case No. 12-00350-UT, in the Recommended Decision, unless noted otherwise. Quay County was not given express approval for a net salvage percent, therefore zero has been used.
 (B) SPS owns the Blackhawk pipeline, but does not own the Blackhawk plant. SPS has a purchase power agreement for power from the Blackhawk plant. Rate per Certification of Stipulation in case 15-00286-UT.
 (C) Since property records do not distinguish between Maddox Unit 2 and Maddox Unit 3, the longer retirement date of Maddox 3 is used to model that facility.
 (D) Some Tolk assets will remain after 2032 to support the transmission system with a retirement date of 2055.
 (E) Approved life and net salvage from the modified stipulation from Case No. 17-00044-UT.
 *Other: Moore County and Riverview were retired in 2013. Carlsbad was retired in 2017.

Notes:

(A) Current retirement dates are those used in approved depreciation rates from Case No. 12-00350-UT, in the Recommended Decision, unless noted otherwise.

(B) SPS owns the Blackhawk pipeline, but does not own the Blackhawk plant. SPS has a purchase power agreement for power from the Blackhawk plant.

Retirement date per approved rates from Case No. 15-00296 UT in Certification of Stipulation.

(C) Since property records do not distinguish between Maddox Unit 2 and Maddox Unit 3, the longer retirement date of Maddox 3 is used to model that facility.

(D) Primarily used for VAR support.

(E) Some Tolk assets will remain after 2032 to support the transmission system with a retirement date of 2055.

(F) Approved life and net salvage from the modified stipulation from Case No. 17-00044-UT.

Other: Moore County and Riverview were retired in 2013. Carlsbad was retired in 2017.

Notes:

(A) Assets have been retired. Remaining reserve balance will be reallocated in the depreciation study.

(B) Assets have been retired. The asset has been excluded from the reserve reallocation. Remaining reserve balance accounting treatment was not determined in Recommended Decision, Case 18-00329 UT, Carlsbad Abandonment.

(C) Blackhawk excluded from reserve reallocation

Notes:

- (A) Approved life and net salvage from Case No.19-00170-UT in Certification of Stipulation, unless noted otherwise.
- (B) SPS owns the Blackhawk pipeline, but does not own the Blackhawk plant. SPS has a purchase power agreement for power from the Blackhawk plant.
- (C) Since property records do not distinguish between Maddox Unit 2 and Maddox Unit 3, the longer retirement date of Maddox 3 is used to model that facility.
- (D) Harrington will be converted from coal to gas in 2024, so coal-related assets retire in 2024. Remaining gas-related assets will retain currently approved terminal retirement dates.

Notes:

- (A) Current Retirement Dates from Case No. 19-00170-UT in Certification of Stipulation, unless noted otherwise.
- (B) Retirement dates from Case No. 20-00238-UT in Certification of Stipulation.
- (C) SPS owns the Blackhawk pipeline, but does not own the Blackhawk plant. SPS has a purchase power agreement for power from the Blackhawk plant.
- (D) Since property records do not distinguish between Maddox Unit 2 and Maddox Unit 3, the longer retirement date of Maddox 3 is used to model that facility.
- (E) Primarily used for VAR support.
- (F) Some Tolk assets will remain after 2032 to support the transmission system with a retirement date of 2055.
- (G) Approved life and retirement date from the modified stipulation from Case No. 17-00044-UT.

Note:
(A) There is currently no balance in these accounts. In the event plant is added to these accounts, SPS requests authorization to use the depreciation rate listed, which represent the composite depreciation rate for each unit.
(B) There is currently no balance in this account. When plant is recorded to this account, SPS requests authorization to use the depreciation rate listed, which represents the whole life rate.
(C) This unit is fully reserved after requested reserve reallocation. SPS requests authorization to use currently approved depreciation rates for these assets in the event of additional Investment.
(D) Existing rates were approved in Certification of Stipulation in 20-00238-UT.

Notes:

(A) Blackhawk excluded from reserve as SPS owns the Blackhawk pipeline, but does not own the Blackhawk plant. SPS has a purchase power agreement for power from the Blackhawk plant.

Notes:

(A) Approved rates from Case No. 20-00238-UT, in Certification of Stipulation, unless noted otherwise.

(B) Approved rates from Case No. 19-00170-UT in Certification of Stipulation.

(C) Assets Amortized over the lease term.

(D) SPS Owns the Blackhawk pipeline, but does not own the Blackhawk plant. SPS has a purchase power agreement for power from the Blackhawk plant.
