1 **I. INTRODUCTION AND PURPOSE**

2

3 Q. PLEASE STATE YOUR NAME, AFFILIATION, AND BUSINESS ADDRESS.

4 A. My name is Dylan W. D'Ascendis. I am employed by ScottMadden, Inc. as
5 Director. My business address is 3000 Atrium Way, Suite 241, Mount Laurel,
6 NJ 08054.

7

8 Q. ON WHOSE BEHALF ARE YOU SUBMITTING THIS TESTIMONY?

9 A. I am submitting this direct testimony (referred to throughout as my Direct
10 Testimony) before the Minnesota Public Utilities Commission (Commission)
11 on behalf of Northern States Power, a Minnesota corporation (NSPM or the
12 Company).

13

14 Q. PLEASE SUMMARIZE YOUR PROFESSIONAL EXPERIENCE AND EDUCATIONAL
15 BACKGROUND.

16 A. I have offered expert testimony on behalf of investor-owned utilities before
17 over 20 state regulatory commissions in the United States, the Federal Energy
18 Regulatory Commission (FERC), the Alberta Utility Commission, and one
19 American Arbitration Association panel on issues including, but not limited
20 to, common equity cost rate, rate of return, valuation, capital structure, class
21 cost of service, and rate design.

22

23 On behalf of the American Gas Association (AGA), I calculate the AGA Gas
24 Index, which serves as the benchmark against which the performance of the
25 American Gas Index Fund (AGIF) is measured on a monthly basis. The AGA
26 Gas Index and AGIF are a market capitalization weighted index and mutual

1 fund, respectively, comprised of the common stocks of the publicly traded
2 corporate members of the AGA.

3
4 I am a member of the Society of Utility and Regulatory Financial Analysts
5 (SURFA). In 2011, I was awarded the professional designation “Certified Rate
6 of Return Analyst” by SURFA, which is based on education, experience, and
7 the successful completion of a comprehensive written examination.

8
9 I am also a member of the National Association of Certified Valuation
10 Analysts (NACVA) and was awarded the professional designation “Certified
11 Valuation Analyst” by NACVA in 2015.

12
13 I am a graduate of the University of Pennsylvania, where I received a Bachelor
14 of Arts degree in Economic History. I have also received a Master of Business
15 Administration with high honors and concentrations in Finance and
16 International Business from Rutgers University.

17
18 The details of my educational background and expert witness appearances are
19 shown in Appendix A.

20
21 Q. WHAT IS THE PURPOSE OF YOUR DIRECT TESTIMONY?

22 A. The purpose of my testimony is to present evidence on behalf of the Company
23 and recommend the appropriate return on common equity (ROE) to be used
24 in setting rates in this proceeding. My testimony first provides a summary of
25 financial theory and regulatory principles pertinent to the development of the
26 recommended cost of capital. I then: (1) evaluate the Company’s proposed

1 capital structure; and (2) present evidence and analysis on the appropriate
2 ROE on its Minnesota jurisdictional rate base. My testimony concludes with
3 a discussion of the current capital market environment and how it influences
4 cost of capital issues in this proceeding.

5
6 Q. HAVE YOU PREPARED SCHEDULES IN SUPPORT OF YOUR RECOMMENDATION?

7 A. Yes. I have prepared Exhibit____(DWD-1), which contains Schedules 1
8 through 9, and were prepared by me or under my direction.

9
10 **II. SUMMARY**

11
12 Q. PLEASE SUMMARIZE YOUR RECOMMENDED ROE.

13 A. My recommended ROE of 10.20% is summarized on page 2 of
14 Exhibit____(DWD-1), Schedule 1. In determining my recommendation, I
15 assessed the market-based common equity cost rates of companies of
16 relatively similar, but not necessarily identical, risk to the Company. Using
17 companies of relatively comparable risk as proxies is consistent with the
18 principles of fair rate of return established in the *Hope*¹ and *Bluefield*² decisions,
19 which I discuss further in Section III, below. Of course, no proxy group can
20 be identical in risk to any single company. Consequently, there must be an
21 evaluation of relative risk between the Company and the proxy group to
22 determine if it is appropriate to adjust the proxy group's indicated rate of
23 return.

24

1 *Federal Power Comm'n v. Hope Natural Gas Co.*, 320 U.S. 591 (1944) (*Hope*).

2 *Bluefield Water Works Improvement Co. v. Public Serv. Comm'n*, 262 U.S. 679 (1922) (*Bluefield*).

My recommendation results from applying and considering several cost of common equity models, specifically the Constant Growth and Two Growth forms of the Discounted Cash Flow model (DCF), the Risk Premium Model (RPM), and the Capital Asset Pricing Model (CAPM), to the market data of the Utility Proxy Group whose selection criteria will be discussed below. In addition, I applied these same models to a Non-Price Regulated Proxy Group. The results derived from these analyses are as follows:

Table 1
Summary of Common Equity Cost Rates³

Discounted Cash Flow Model	8.72%
Risk Premium Model	10.43%
Capital Asset Pricing Model	12.14%
Cost of Equity Models Applied to Comparable Risk, Non-Price Regulated Companies	<u>12.03%</u>
Indicated Range of Common Equity Cost Rates Before Adjustments	9.77% - 10.83%
Size Adjustment	0.05%
Credit Risk Adjustment	-0.12%
Flotation Cost Adjustment	0.15%
Indicated Range of Common Equity Cost Rates after Adjustment	<u>9.85% - 10.91%</u>
Recommended Cost of Common Equity	<u>10.20%</u>

³ See Section VI for a detailed discussion regarding the application of my cost of common equity models.

1 The indicated range of common equity cost rates applicable to the Utility
2 Proxy Group is between 9.77% and 10.83% before any Company-specific
3 adjustments.⁴ I then adjusted the indicated common equity cost rate upward
4 by 0.05% to reflect the Company's smaller relative size and downward by
5 0.12% to account for a less risky bond rating, as compared to the Utility Proxy
6 Group. I also adjusted the indicated common equity cost rate upward by
7 0.15% to account for flotation costs.⁵ These adjustments resulted in a
8 Company-specific indicated range of common equity cost rates between
9 9.85% and 10.91%. Given the Utility Proxy Group and Company-specific
10 ranges of common equity cost rates, my recommended ROE for the Company
11 is 10.20%.

12
13 Q. PLEASE SUMMARIZE THE COMPANY'S PROPOSED CAPITAL STRUCTURE.

14 A. The Company is proposing projected capital structures which include a
15 52.50% common equity ratio. That common equity ratio is consistent with
16 the Company's historical equity ratios, the equity ratios maintained by the
17 Utility Proxy Group and their operating subsidiary companies.

18
19 Q. HOW IS THE REMAINDER OF YOUR DIRECT TESTIMONY ORGANIZED?

20 A. The remainder of my Direct Testimony is organized as follows:

- 21 • Section III – Provides a summary of financial theory and regulatory principles
22 pertinent to the development of the Cost of Capital;
- 23 • Section IV – Explains the proposed capital structure;

4 The 9.77% low end of the range is calculated by taking the average model result (10.83%), and averaging that with the lowest model result (8.72%). The 10.83% high end of the range is the approximate average of all model results.

5 See Section VIII for a detailed discussion of my cost of common equity adjustments.

- Section V – Explains my selection of the Utility Proxy Group used to develop my Cost of Common Equity analytical results;
- Section VI – Describes the analyses on which my Cost of Common Equity recommendation is based;
- Section VII – Summarizes my common equity cost rate before adjustments to reflect Company-specific factors;
- Section VIII – Explains my adjustments to my common equity cost rate before to reflect Company-specific factors;
- Section IX – Provides an overview of the current capital market environment; and
- Section X – Presents my conclusions.

III. GENERAL PRINCIPLES

Q. WHAT PRINCIPLES HAVE YOU CONSIDERED IN ARRIVING AT YOUR RECOMMENDATIONS?

A. In unregulated industries, marketplace competition is the principal determinant of the price of products or services. For regulated public utilities, regulation must act as a substitute for marketplace competition. Assuring that the utility can fulfill its obligations to the public, while providing safe and reliable service at all times, requires a level of earnings sufficient to maintain the integrity of presently invested capital. Sufficient earnings also permit the attraction of needed new capital at a reasonable cost, for which the utility must compete with other firms of comparable risk, consistent with the fair rate of return standards established by the U.S. Supreme Court in the previously cited *Hope* and *Bluefield* cases.

1 The U.S. Supreme Court affirmed the fair rate of return standards in *Hope*,
2 when it stated:

3 The rate-making process under the Act, *i.e.*, the fixing of ‘just
4 and reasonable’ rates, involves a balancing of the investor and
5 the consumer interests. Thus we stated in the Natural Gas
6 Pipeline Co. case that ‘regulation does not insure that the
7 business shall produce net revenues.’ 315 U.S. at page 590, 62
8 S.Ct. at page 745. But such considerations aside, the investor
9 interest has a legitimate concern with the financial integrity
10 of the company whose rates are being regulated. From the
11 investor or company point of view it is important that there
12 be enough revenue not only for operating expenses but also
13 for the capital costs of the business. These include service
14 on the debt and dividends on the stock. Cf. *Chicago &*
15 *Grand Trunk R. Co. v. Wellman*, 143 U.S. 339, 345, 346 12
16 S.Ct. 400,402. By that standard the return to the equity owner
17 should be commensurate with returns on investments in
18 other enterprises having corresponding risks. That return,
19 moreover, should be sufficient to assure confidence in the
20 financial integrity of the enterprise, so as to maintain its credit
21 and to attract capital.⁶
22

23 In summary, the U.S. Supreme Court has found a return that is adequate to
24 attract capital at reasonable terms enables the utility to provide service while
25 maintaining its financial integrity. As discussed above, and in keeping with
26 established regulatory standards, that return should be commensurate with the
27 returns expected elsewhere for investments of equivalent risk. The
28 Commission’s decision in this proceeding, therefore, should provide the
29 Company with the opportunity to earn a return that is: (1) adequate to attract
30 capital at reasonable cost and terms; (2) sufficient to ensure their financial

6 *Hope*, 320 U.S. 591 (1944), at 603.

1 integrity; and (3) commensurate with returns on investments in enterprises
2 having corresponding risks.

3
4 Lastly, the required return for a regulated public utility is established on a
5 stand-alone basis, i.e., for the utility operating company at issue in a rate case.
6 Parent entities, like other investors, have capital constraints and must look at
7 the attractiveness of the expected risk-adjusted return of each investment
8 alternative in their capital budgeting process. That is, utility holding
9 companies that own many utility operating companies have choices as to
10 where they will invest their capital within the holding company family.
11 Therefore, the opportunity cost concept applies regardless of the source of
12 the funding, public funding or corporate funding.

13
14 When funding is provided by a parent entity, the return still must be sufficient
15 to provide an incentive to allocate equity capital to the subsidiary or business
16 unit rather than other internal or external investment opportunities. That is,
17 the regulated subsidiary must compete for capital with all the parent
18 company's affiliates, and with other, similarly situated utility companies. In
19 that regard, investors value corporate entities on a sum-of-the-parts basis and
20 expect each division within the parent company to provide an appropriate
21 risk-adjusted return.

22
23 It therefore is important that the authorized ROE reflects the risks and
24 prospects of the utility's operations and supports the utility's financial integrity
25 from a stand-alone perspective as measured by their combined business and
26 financial risks. Consequently, the ROE authorized in this proceeding should

1 be sufficient to support the operational (*i.e.*, business risk) and financing (*i.e.*,
2 financial risk) of the Company's Minnesota utility operations on a stand-alone
3 basis.

4
5 Q. WITHIN THAT BROAD FRAMEWORK, HOW IS THE COST OF CAPITAL ESTIMATED
6 IN REGULATORY PROCEEDINGS?

7 A. Regulated utilities primarily use common stock and long-term debt to finance
8 their permanent property, plant, and equipment (*i.e.*, rate base). The fair rate
9 of return for a regulated utility is based on its WACC, in which, as noted
10 earlier, the costs of the individual sources of capital are weighted by their
11 respective book values.

12
13 The cost of capital is the return investors require to make an investment in a
14 firm. Investors will provide funds to a firm only if the return that they *expect*
15 is equal to, or greater than, the return that they *require* to accept the risk of
16 providing funds to the firm.

17
18 The cost of capital (that is, the combination of the costs of debt and equity) is
19 based on the economic principle of "opportunity costs." Investing in any
20 asset (whether debt or equity securities) represents a forgone opportunity to
21 invest in alternative assets. For any investment to be sensible, its expected
22 return must be at least equal to the return expected on alternative, comparable
23 risk investment opportunities. Because investments with like risks should
24 offer similar returns, the opportunity cost of an investment should equal the
25 return available on an investment of comparable risk.

1 Whereas the cost of debt is contractually defined and can be directly observed
2 as the interest rate or yield on debt securities, the cost of equity must be
3 estimated based on market data and various financial models. Because the
4 cost of equity is premised on opportunity costs, the models used to determine
5 it are typically applied to a group of “comparable” or “proxy” companies.

6
7 In the end, the estimated cost of capital should reflect the return that investors
8 require in light of the subject company’s business and financial risks, and the
9 returns available on comparable investments.

10
11 Q. IN VIEW OF THE COMPARABLE RISK STANDARD, HAVE YOU REVIEWED
12 AUTHORIZED RETURNS FOR OTHER VERTICALLY INTEGRATED ELECTRIC
13 UTILITIES?

14 A. Yes, I have. An overarching principle in determining a fair rate of return is to
15 ensure that the Company is allowed the ability to earn a return commensurate
16 to that earned by other enterprises with similar risks. In that regard, the
17 Commission should keep in mind that the Company competes for capital with
18 all companies with comparable risk, including other operating subsidiaries of
19 Xcel Energy’s (XEI). Therefore, two high level checks on the reasonableness
20 of a return on equity result are to examine the returns being allowed to the
21 parent company utility operations in other jurisdictions and the returns being
22 authorized to other utilities across the country. While such comparisons are
23 admittedly imperfect and may reflect somewhat dated regulatory
24 determinations, they can still inform the overall reasonableness of the
25 Commission’s consideration.

NSPM's 9.06% authorized return in Minnesota is the lowest among XEI's regulated utility operating subsidiaries.⁷

Table 2
Xcel Energy Vertically Integrated Electric Authorized Returns⁸

Company	Jurisdiction	Date	Authorized ROE
Southwestern Public Service Co.	Texas	8/27/2020	9.45%
Southwestern Public Service Co.	New Mexico	5/20/2020	9.45%
Public Service Co. of CO	Colorado	2/11/2020	9.30%
Northern States Power - MN	Minnesota	9/29/2019	9.06%
Northern States Power - WI	Wisconsin	9/4/2019	10.00%
Northern States Power - MN	North Dakota	2/26/2014	9.75%
Northern States Power - MN	South Dakota	6/19/2012	9.25%

In addition, As shown in Charts 1 and 2, below, recently authorized returns for vertically integrated electric utilities in Minnesota have been among the lowest in the country and in the Upper Midwest region.

⁷ The Commission noted in Docket E002/M-17-797: "Continuing to use this ROE going forward will provide administrative efficiency, and the Commission will therefore require Xcel to use an ROE of 9.06% in all electric dockets filed by the Company that require an ROE until the Commission issues an order in the Company's next rate case authorizing a different ROE." *In the Matter of the Petition of Northern States Power Company for Approval of the Transmission Cost Recovery Rider Revenue Requirements for 2017 and 2018, and Revised Adjustment Factor*, Docket No. E002/M-17-797, September 29, 2019, at 8. See, also, *In the Matter of the Petition of Northern States Power Company for Approval of the Renewable Energy Standards (RES) Rider Revenue Requirements for 2017 and 2018 and RES Adjustment Factors*, Docket No. E002/M-17-818, September 30, 2019, at 3.

Chart 1

U.S. Vertically Integrated Electric Authorized ROEs⁹

Chart 2

Upper Midwest Vertically Integrated Electric Authorized ROEs¹⁰

⁹ Source: S&P Global Market Intelligence.

¹⁰ *Ibid.*

1 Although I recognize that the Commission is not beholden to set the
2 authorized return for the Company based on returns available to utilities in
3 other jurisdictions, that data provides a relevant benchmark against which to
4 assess the Company's currently authorized return of 9.06%. For example,
5 NSPM is at a competitive disadvantage relative to XEI's other operating
6 subsidiaries because the Company's authorized return in Minnesota is lower
7 than that of XEI's other operating subsidiaries.

8
9 **A. Business Risk**

10 Q. PLEASE DEFINE BUSINESS RISK AND EXPLAIN WHY IT IS IMPORTANT FOR
11 DETERMINING A FAIR RATE OF RETURN.

12 A. The investor-required return on common equity reflects investors' assessment
13 of the total investment risk of the subject firm. Total investment risk is often
14 discussed in the context of business and financial risk.

15
16 Business risk reflects the uncertainty associated with owning a company's
17 common stock without the company's use of debt and/or preferred stock
18 financing. One way of considering the distinction between business and
19 financial risk is to view the former as the uncertainty of the expected earned
20 return on common equity, assuming the firm is financed with no debt.

21
22 Examples of business risks generally faced by utilities include, but are not
23 limited to, the regulatory environment, mandatory environmental compliance
24 requirements, customer mix and concentration of customers, service territory
25 economic growth, market demand, risks and uncertainties of supply,
26 operations, capital intensity, size, the degree of operating leverage, emerging

1 technologies including distributed energy resources, the vagaries of weather,
2 and the like, all of which have a direct bearing on earnings.

3
4 Although analysts, including rating agencies, may categorize business risks
5 individually, as a practical matter, such risks are interrelated and not wholly
6 distinct from one another. When determining an appropriate return on
7 common equity, the relevant issue is where investors see the subject company
8 in relation to other similarly situated utility companies (i.e., the Utility Proxy
9 Group). To the extent investors view a company as being exposed to higher
10 risk, the required return will increase, and vice versa.

11
12 For regulated utilities, business risks are both long-term and near-term in
13 nature. Whereas near-term business risks are reflected in year-to-year
14 variability in earnings and cash flow brought about by economic or regulatory
15 factors, long-term business risks reflect the prospect of an impaired ability of
16 investors to obtain both a fair rate of return on, and return of, their capital.
17 Moreover, because utilities accept the obligation to provide safe, adequate and
18 reliable service at all times (in exchange for a reasonable opportunity to earn
19 a fair return on their investment), they generally do not have the option to
20 delay, defer, or reject capital investments. Because those investments are
21 capital-intensive, utilities generally do not have the option to avoid raising
22 external funds. The obligation to serve and the corresponding need to access
23 capital is even more acute during periods of capital market distress.

24
25 Because utilities invest in long-lived assets, long-term business risks are of
26 paramount concern to equity investors. That is, the risk of not recovering the

1 return on their investment extends far into the future. The timing and nature
2 of events that may lead to losses, however, also are uncertain and,
3 consequently, those risks and their implications for the required return on
4 equity tend to be difficult to quantify. Regulatory commissions (like investors
5 who commit their capital) must review a variety of quantitative and qualitative
6 data and apply their reasoned judgment to determine how long-term risks
7 weigh in their assessment of the market-required return on common equity.

8
9 **B. Financial Risk**

10 Q. PLEASE DEFINE FINANCIAL RISK AND EXPLAIN WHY IT IS IMPORTANT IN
11 DETERMINING A FAIR RATE OF RETURN.

12 A. Financial risk is the additional risk created by the introduction of debt and
13 preferred stock into the capital structure. The higher the proportion of debt
14 and preferred stock in the capital structure, the higher the financial risk to
15 common equity owners (*i.e.*, failure to receive dividends due to default or other
16 covenants). Therefore, consistent with the basic financial principle of risk and
17 return, common equity investors require higher returns as compensation for
18 bearing higher financial risk.

19
20 Q. CAN BOND AND CREDIT RATINGS BE A PROXY FOR A FIRM'S COMBINED
21 BUSINESS AND FINANCIAL RISKS TO EQUITY OWNERS (I.E. INVESTMENT RISK)?

22 A. Yes, similar bond ratings/issuer credit ratings reflect, and are representative
23 of, similar combined business and financial risks (*i.e.*, total risk) faced by bond
24 investors.¹¹ Although specific business or financial risks may differ between

11 Risk distinctions within S&P's bond rating categories are recognized by a plus or minus, e.g., within the A category, an S&P rating can be an A+, A, or A-. Similarly, risk distinction for Moody's ratings are distinguished by numerical rating gradations, e.g., within the A category, a Moody's rating can be A1, A2 and A3.

1 companies, the same bond/credit rating indicates that the combined risks are
2 roughly similar from a debtholder perspective. The caveat is that these
3 debtholder risk measures do not translate directly to risks for common equity.
4

5 IV. NSPM AND THE UTILITY PROXY GROUP

6

7 Q. WHY IS IT NECESSARY TO DEVELOP A PROXY GROUP WHEN ESTIMATING THE
8 ROE FOR THE COMPANY?

9 A. Because the Company is not publicly traded and does not have publicly traded
10 equity securities, it is necessary to develop groups of publicly traded,
11 comparable companies to serve as “proxies” for the Company. In addition to
12 the analytical necessity of doing so, the use of proxy companies is consistent
13 with the *Hope*, and *Bluefield* comparable risk standards, as discussed above. I
14 have selected two proxy groups that, in my view, are fundamentally risk-
15 comparable to the Company: A Utility Proxy Group and a Non-Price
16 Regulated Proxy Group, which is comparable in total risk to the Utility Proxy
17 Group.¹²
18

19 Even when proxy groups are carefully selected, it is common for analytical
20 results to vary from company to company. Despite the care taken to ensure
21 comparability, because no two companies are identical, market expectations
22 regarding future risks and prospects will vary within the proxy group. It
23 therefore is common for analytical results to reflect a seemingly wide range,
24 even for a group of similarly situated companies. At issue is how to estimate
25 the ROE from within that range. That determination will be best informed

12 The development of the Non-Price Regulated Proxy Group is explained in more detail in Section VI.

1 by employing a variety of sound analyses and necessarily must consider the
2 sort of quantitative and qualitative information discussed throughout my
3 Direct Testimony. Additionally, a relative risk analysis between the Company
4 and the Utility Proxy Group must be made to determine whether or not
5 explicit Company-specific adjustments need to be made to the Utility Proxy
6 Group indicated results.

7
8 My analyses are based on the Utility Proxy Group, containing U.S. electric
9 utilities. As discussed earlier, utilities must compete for capital with other
10 companies with commensurate risk (including non-utilities) and, to do so,
11 must be provided the opportunity to earn a fair and reasonable return.
12 Consequently, it is appropriate to consider the Utility Proxy Group's market
13 data in determining the Company's ROE.

14
15 Q. PLEASE SUMMARIZE THE COMPANY'S OPERATIONS.

16 A. NSPM is a vertically integrated electric and natural gas utility that provides
17 electric generation, transmission, and distribution service, as well as natural
18 gas distribution service to approximately 1,500,000 retail electric customers
19 and 525,000 natural gas customers in North Dakota, Minnesota, and South
20 Dakota.¹³ The Company has long-term issuer ratings of A2 from Moody's
21 Investor Services (Moody's) and A- from Standard and Poor (S&P).¹⁴ The
22 Company is not publicly-traded as it is an operating subsidiary of Xcel Energy
23 Inc. (XEI or the Parent). XEI is publicly-traded under ticker symbol XEL.

13 ¹³ See, Northern States Power Company, SEC Form 10-K at 4, 7 (Dec. 31, 2019).

14 ¹⁴ Source: S&P Global Market Intelligence.

1 Page 1 of Exhibit___(DWD-1), Schedule 2 contains comparative
2 capitalization and financial statistics for the Company for the years 2015 to
3 2019.¹⁵ During the five-year period ending 2019, the historically achieved
4 average earnings rate on book common equity for the Company averaged
5 8.29%. The average common equity ratio based on total permanent capital
6 (excluding short-term debt) was 52.59%, and the average dividend payout
7 ratio was 94.56%.

8
9 Total debt to earnings before interest, taxes, depreciation, and amortization
10 for the years 2015 to 2019 ranges between 3.16 and 3.97 times, with an average
11 of 3.53 times. Funds from operations to total debt range from 20.69% to
12 28.13%, with an average of 25.72%.

13
14 Q. PLEASE EXPLAIN HOW YOU CHOSE THE COMPANIES IN THE UTILITY PROXY
15 GROUP.

16 A. Because the Cost of Equity is a comparative exercise, my objective in
17 developing a proxy group was to select companies that are comparable to the
18 Company. Because the Company is a 100% rate regulated vertically integrated
19 electric utility, I applied the following criteria to select my Utility Proxy Group:

- 20 (i) They were included in the Eastern, Central, or Western Electric Utility
21 Group of *Value Line Investment Survey* (Standard Edition)(*Value Line*);
22 (ii) They have 70% or greater of fiscal year 2019 total operating income
23 derived from, and 70% or greater of fiscal year 2019 total assets
24 attributable to, regulated electric operations;

15 Source: NSPM FERC Form 1. Reflects entire operations of the Company.

- 1 (iii) They are vertically integrated (*i.e.*, utilities that own and operate
2 regulated generation, transmission, and distribution assets);
- 3 (iv) At the time of preparation of this testimony, they had not publicly
4 announced that they were involved in any major merger or acquisition
5 activity (*i.e.*, one publicly-traded utility merging with or acquiring
6 another) or any other major development;
- 7 (v) They have not cut or omitted their common dividends during the five
8 years ended 2019 or through the time of preparation of this testimony;
- 9 (vi) They have *Value Line* and Bloomberg Professional Services
10 (Bloomberg) adjusted Betas;
- 11 (vii) They have positive *Value Line* five-year dividends per share (DPS)
12 growth rate projections; and
- 13 (viii) They have *Value Line*, Zacks, or Yahoo! Finance consensus five-year
14 earnings per share (EPS) growth rate projections.
- 15 The following 15 companies met these criteria:

Table 3

Utility Proxy Group Companies

Company Name	Ticker Symbol
ALLETE, Inc.	ALE
Alliant Energy Corporation	LNT
Ameren Corporation	AEE
Duke Energy Corporation	DUK
Edison International	EIX
Entergy Corporation	ETR
Evergy, Inc.	EVRG
IDACORP, Inc.	IDA
NorthWestern Corporation	NWE
OGE Energy Corporation	OGE
Otter Tail Corporation	OTTR
Pinnacle West Capital Corporation	PNW
PNM Resources, Inc.	PNM
Portland General Electric Co.	POR
Xcel Energy, Inc.	XEL

Q. PLEASE SUMMARIZE THE UTILITY PROXY GROUP'S HISTORICAL CAPITALIZATION AND FINANCIAL STATISTICS.

A. Page 2 of Exhibit___(DWD-1), Schedule 2 contains comparative capitalization and financial statistics for the Utility Proxy Group for the years 2015 to 2019.

During the five-year period ending 2019, the historically achieved average earnings rate on book common equity for the group averaged 8.54%, the average common equity ratio based on total permanent capital (excluding short-term debt) was 48.49%, and the average dividend payout ratio was 61.41%.

1 Total debt to earnings before interest, taxes, depreciation, and amortization
2 for the years 2015 to 2019 ranges between 4.02 and 5.28 times, with an average
3 of 4.63 times. Funds from operations to total debt range from 15.23% to
4 23.09%, with an average of 19.49%. Given those capitalization and financial
5 statistics, I conclude the Utility Proxy Group is generally comparable to the
6 Company.

7 8 **V. CAPITAL STRUCTURE**

9
10 Q. HOW DOES THE CAPITAL STRUCTURE AFFECT THE RATE OF RETURN?

11 A. As discussed above, there are two general categories of risk: business risk and
12 financial risk. The capital structure relates to a company's financial risk, which
13 represents the risk that a company may not have adequate cash flows to meet
14 its financial obligations, and is a function of the percentage of debt (or
15 financial leverage) in its capital structure. In that regard, as the percentage of
16 debt in the capital structure increases, so do the fixed obligations for the
17 repayment of that debt. Consequently, as the degree of financial leverage
18 increases, the risk of financial distress (*i.e.*, financial risk) also increases.¹⁶ In
19 essence, even if two firms face the same business risks, a company with
20 meaningfully higher levels of debt in its capital structure is likely to have a
21 higher cost of both debt and equity. Since the capital structure can affect the
22 subject company's overall level of risk, it is an important consideration in
23 establishing a just and reasonable rate of return.

16 Roger A. Morin, New Regulatory Finance, Public Utility Reports, Inc., 2006, at 45-46. (Morin)

1 Q. IS THERE SUPPORT FOR THE PROPOSITION THAT THE CAPITAL STRUCTURE IS A
2 KEY CONSIDERATION IN ESTABLISHING AN APPROPRIATE RATE OF RETURN?

3 A. Yes. The Supreme Court and various utility commissions have long
4 recognized the role of capital structure in the development of a just and
5 reasonable rate of return for a regulated utility. In particular, a utility's
6 leverage, or debt ratio, has been explicitly recognized as an important element
7 in determining a just and reasonable rate of return:

8 Although the determination of whether bonds or stocks
9 should be issued is for management, the matter of debt ratio
10 is not exclusively within its province. Debt ratio substantially
11 affects the manner and cost of obtaining new capital. It is
12 therefore an important factor in the rate of return and must
13 necessarily be considered by and come within the authority
14 of the body charged by law with the duty of fixing a just and
15 reasonable rate of return.¹⁷
16

17 Perhaps ultimate authority for balancing the issues of cost and financial
18 integrity is found in the Supreme Court's statement in *Hope*:

19
20 The rate-making process under the Act, i.e., the fixing of "just
21 and reasonable" rates, involves a balancing of the investor and
22 the consumer interests.¹⁸
23

24 And as the U.S. Court of Appeals, District of Columbia Circuit found in
25 *Communications Satellite Corp. et. al. v. FCC*:

26 The equity investor's stake is made less secure as the
27 company's debt rises, but the consumer rate-payer's is

17 *New England Telephone & Telegraph Co. v. State*, 98 N.H. 211, 97 A.2d 213, (1953), citing *New England Tel. & Tel. Co. v. Department of Pub. Util.*, (Mass.) 327 Mass. 81, 97 N.E. 2d 509, 514; *Petitions of New England Tel. & Tel. Co.* 116 Vt. 480, 80 A2d 671, at 6.

18 *Federal Power Commission v. Hope Natural Gas Co.*, 320 U.S., at 603 (1944).

1 alleviated.¹⁹

2
3 That is, the U.S. Court of Appeals, District of Columbia Circuit found that
4 because there is a relationship between the capital structure and the cost of
5 equity, investor and consumer interests must be balanced. Consequently, the
6 principles of fairness and reasonableness with respect to the allowed rate of
7 return and capital structure are considered at both the federal and state levels.
8

9 Q. PLEASE SUMMARIZE THE COMPONENTS OF THE COMPANY'S RECOMMENDED
10 CAPITAL STRUCTURE AND WACC.

11 A. The Company's proposed test year capital structure includes long-term debt,
12 short-term debt, and common equity. The Company's proposed revenue
13 requirement for the test year reflects a WACC of 7.35%.²⁰
14

15 Q. DOES THE COMPANY HAVE A SEPARATE CAPITAL STRUCTURE THAT IS
16 RECOGNIZED BY INVESTORS?

17 A. Yes. The Company is a separate corporate entity that has its own capital
18 structure and issues its own debt with the Securities and Exchange
19 Commission.
20

21 Q. WHY IS IT IMPORTANT THAT THE COMPANY'S ACTUAL CAPITAL STRUCTURE BE
22 AUTHORIZED FOR THE COMPANY IN THIS PROCEEDING?

23 A. As a preliminary matter, the Company's actual capital structure is known and
24 measurable, and is within a reasonable range from the perspective of the

19 *Communications Satellite Corp. et. al. v. FCC*, 198 U.S. App. D.C. 60, 63-64611 F.2d 883.
20 See, Direct Testimony of Sarah W. Soong.

1 Utility Proxy Group companies.²¹ The use of an operating subsidiary's actual
2 capital structure is consistent with the FERC's precedent, under which they
3 use the applicant's capital structure, where possible.²² In particular, the FERC
4 will use the utility operating company's capital structure if it meets three
5 criteria: (1) it issues its own debt without guarantees; (2) it has its own bond
6 rating; and (3) it has a capital structure within the range of capital structures
7 approved by the commission.²³ The Company meets all of these criteria.

8
9 Importantly, in order to provide safe, reliable, and affordable service to its
10 customers, the Company must meet the needs and serve the interests of its
11 various stakeholders, including customers, shareholders, and bondholders.
12 The interests of these stakeholder groups are aligned when the Company
13 maintains a healthy balance sheet, strong credit ratings, and a supportive
14 regulatory environment, ensuring it has access to capital on reasonable terms
15 in order to make necessary investments.

16
17 Safe and reliable service cannot be maintained at a reasonable cost if utilities
18 do not have the financial flexibility and strength to access competitive
19 financing markets on reasonable terms. The authorization of a capital
20 structure that understates the Company's actual common equity will weaken
21 the financial condition of its operations and adversely impact the Company's
22 ability to address expenses and investment, to the detriment of customers and
23 shareholders. Safe and reliable service for customers cannot be sustained over

21 See Exhibit___(DWD-1), Schedule 2.

22 See, *Transcontinental Gas Pipe Line Corp.*, 80 FERC ¶ 61,157, 61,657 (1997) (Opinion No. 414).

23 148 FERC ¶ 61,049 Docket No. EL14-12-000, at 190.

1 the long term if the interests of shareholders and bondholders are minimized
2 such that the public interest is not optimized.

3
4 Consequently, the Company's existing capital structure should be used to set
5 rates in this proceeding.

6
7 Q. HOW DOES THE COMPANY'S REQUESTED TEST YEAR CAPITAL STRUCTURE
8 COMPARE WITH THE THEIR RECENT CAPITAL STRUCTURES?

9 A. The requested test year capital structure is highly consistent with NSPM's
10 historical capital structures. As shown on Exhibit____(DWD-1), Schedule 2,
11 page 1, the common equity ratios for years 2015 through 2019 range from
12 51.85% to 52.07%, averaging 51.98%.

13
14 Q. HOW DOES NSPM'S ACTUAL COMMON EQUITY RATIO OF 52.50% COMPARE
15 WITH THE COMMON EQUITY RATIOS MAINTAINED BY THE UTILITY PROXY
16 GROUP?

17 A. In order to assess the reasonableness of the Company's requested ratemaking
18 common equity ratio, I reviewed the actual common equity ratios maintained
19 by the comparable companies within the Utility Proxy Group.²⁴ The
20 Company's requested ratemaking common equity ratio of 52.50% is
21 reasonable and consistent with the range of common equity ratios maintained
22 by the Utility Proxy Group. As shown on pages 3 and 4 of Exhibit____(DWD-
23 1), Schedule 2, common equity ratios of the utilities range from 35.73% to
24 58.04% for fiscal year 2019. The Company's actual capital structure
25 demonstrates both the reasonableness of using it to set rates and the

24 The development of the Utility Proxy Group is described more fully in Section IV.

1 Company's relative financial health. Setting the capital structure as requested
2 by the Company will continue to support the long-term financial health of the
3 Company for the benefit of all of its stakeholders, including its customers.

4
5 I also considered *Value Line's* projected capital structures for the Utility Proxy
6 Group for 2023-2025. That analysis shows a range of projected common
7 equity ratios between 39.00% and 59.00%.

8
9 In addition to comparing the Company's ratemaking common equity ratio
10 with common equity ratios currently and expected to be maintained by the
11 Utility Proxy Group (*i.e.*, at the holding company level), I also compared the
12 Company's ratemaking common equity ratio with the equity ratios maintained
13 by the operating subsidiaries of the Utility Proxy Group companies. As shown
14 on page 5 of Exhibit____(DWD-1), Schedule 2, common equity ratios of the
15 operating utility subsidiaries of the Utility Proxy Group range from 45.23% to
16 65.22% for fiscal year 2019.

17
18 Q. IS THE COMPANY'S PROPOSED EQUITY RATIO OF 52.50% APPROPRIATE FOR
19 RATEMAKING PURPOSES GIVEN THE RANGE OF THE UTILITY PROXY GROUP?

20 A. Yes, it is. The Company's proposed equity ratio of 52.50% is appropriate for
21 ratemaking purposes in the current proceeding because it is the actual equity
22 ratio of NSPM, and it is well within industry norms.

VI. COMMON EQUITY COST RATE MODELS

Q. IS IT IMPORTANT THAT COST OF COMMON EQUITY MODELS BE MARKET-BASED?

A. Yes. As discussed previously, regulated public utilities, like the Company, must compete for equity in capital markets along with all other companies with commensurate risk, including non-utilities. The cost of common equity is thus determined based on equity market expectations for the returns of those companies. If an individual investor is choosing to invest their capital among companies with comparable risk, they will choose the company providing a higher return over a company providing a lower return.

Q. ARE THE COST OF COMMON EQUITY MODELS YOU USE MARKET-BASED MODELS?

A. Yes. The DCF model is market-based in that market prices are used in developing the dividend yield component of the model. The RPM and CAPM are also market-based in that the bond/issuer ratings and expected bond yields/risk-free rate used in the application of the RPM and CAPM reflect the market's assessment of bond/credit risk. In addition, the use of the Beta coefficient to determine the equity risk premium also reflects the market's assessment of market/systematic risk, as Beta coefficients are derived from regression analyses of market prices. Moreover, market prices are used in the development of the monthly returns and equity risk premiums used in the Predictive Risk Premium Model (PRPM). Selection criteria for the Non-Price Regulated Proxy Group are based on regression analyses of market prices and reflect the market's assessment of total risk.

1 Q. WHAT ANALYTICAL APPROACHES DID YOU USE TO DETERMINE THE
2 COMPANY'S ROE?

3 A. As discussed earlier, I have relied on the DCF model, the RPM, and the
4 CAPM, which I apply to the Utility Proxy Group described above. I also
5 applied these same models to a Non-Price Regulated Proxy Group described
6 later in this section.

7
8 I rely on these models because reasonable investors use a variety of tools and
9 do not rely exclusively on a single source of information or single model.
10 Moreover, the models on which I rely focus on different aspects of return
11 requirements, and provide different insights to investors' views of risk and
12 return. The DCF model, for example, estimates the investor-required return
13 assuming a constant expected dividend yield and growth rate in perpetuity,
14 while Risk Premium-based methods (*i.e.*, the RPM and CAPM approaches)
15 provide the ability to reflect investors' views of risk, future market returns,
16 and the relationship between interest rates and the Cost of Equity. Just as the
17 use of market data for the Utility Proxy Group adds the reliability necessary
18 to inform expert judgment in arriving at a recommended common equity cost
19 rate, the use of multiple generally accepted common equity cost rate models
20 also adds reliability and accuracy when arriving at a recommended common
21 equity cost rate.

22
23 **A. Discounted Cash Flow Model**

24 Q. PLEASE DESCRIBE THE DCF MODEL GENERALLY.

25 A. The theory underlying the DCF model is that the present value of an expected
26 future stream of net cash flows during the investment holding period can be

determined by discounting those cash flows at the cost of capital, or the investors' capitalization rate. DCF theory indicates that an investor buys a stock for an expected total return rate, which is derived from the cash flows received from dividends and market price appreciation. Mathematically, the expected dividend yield on market price plus a growth rate equals the capitalization rate; *i.e.*, the total common equity return rate expected by investors, as shown in Equation [1] below:

$$K_e = (D_0 (1+g))/P + g$$

where:

K_e = the required Return on Equity;

D_0 = the annualized Dividend Per Share;

P = the current stock price; and

g = the growth rate.

Q. WHICH VERSIONS OF THE DCF MODEL DID YOU USE?

A. I used the single-stage Constant Growth DCF model and the Two Growth DCF model in my analyses.

Q. PLEASE DESCRIBE THE DIVIDEND YIELD YOU USED IN APPLYING THE CONSTANT GROWTH DCF MODEL.

A. The unadjusted dividend yields are based on the proxy companies' dividends as of August 31, 2020, divided by the average closing market price for the 60 trading days ended August 31, 2020.²⁵

²⁵ See, Column 1, page 1 of Exhibit____(DWD-1), Schedule 3.

1 Q. PLEASE EXPLAIN YOUR ADJUSTMENT TO THE DIVIDEND YIELD.

2 A. Because dividends are paid periodically (*e.g.* quarterly), as opposed to
3 continuously (daily), an adjustment must be made to the dividend yield. This
4 is often referred to as the discrete, or the Gordon Periodic, version of the
5 DCF model.

6
7 DCF theory calls for using the full growth rate, or D_1 , in calculating the
8 model's dividend yield component. Since the companies in the Utility Proxy
9 Group increase their quarterly dividends at various times during the year, a
10 conservative assumption is to reflect one-half the annual dividend growth rate
11 rather than the full growth rate in the dividend yield component, or $D_{1/2}$.
12 Because the dividend should be representative of the next 12-month period,
13 this adjustment is a conservative approach that does not overstate the
14 dividend yield. Therefore, the actual average dividend yields in Column 1,
15 page 1 of Exhibit___(DWD-1), Schedule 3 have been adjusted upward to
16 reflect one-half the average projected growth rate shown in Column 6.

17
18 Q. PLEASE EXPLAIN THE BASIS FOR THE GROWTH RATES YOU APPLY IN YOUR
19 CONSTANT GROWTH DCF MODEL.

20 A. Investors with more limited resources than institutional investors are likely to
21 rely on widely available financial information services, such as *Value Line*,
22 Zacks, and Yahoo! Finance. Investors realize that analysts have significant
23 insight into the dynamics of the industries and individual companies they
24 analyze, as well as companies' abilities to effectively manage the effects of
25 changing laws and regulations, and ever-changing economic and market

1 conditions. For these reasons, I used analysts' five-year forecasts of EPS
2 growth in my DCF analysis.

3
4 Over the long run, there can be no growth in DPS without growth in EPS.
5 Security analysts' earnings expectations have a more significant influence on
6 market prices than dividend expectations. Thus, using projected earnings
7 growth rates in a DCF analysis provides a better match between investors'
8 market price appreciation expectations and the growth rate component of the
9 DCF.

10
11 Q. PLEASE SUMMARIZE THE CONSTANT GROWTH DCF MODEL RESULTS.

12 A. As shown on page 1 of Exhibit____(DWD-1), Schedule 3, the application of
13 the Constant Growth DCF model to the Utility Proxy Group results in a wide
14 range of indicated ROEs from 5.96% to 10.75%. The mean of those results
15 is 8.58%, the median result is 8.66%, and the average of the two is 8.62%. In
16 arriving at a conclusion of the indicated common equity cost rate for the
17 Utility Proxy Group implied by the Constant Growth DCF model, I relied on
18 an average of the mean and the median results (*i.e.*, 8.62%) of the DCF. By
19 doing so, I have considered the DCF results for each company without giving
20 undue weight to outliers on either the high or the low side.

21
22 Q. DID YOU CONSIDER ANY OTHER CONSTANT GROWTH DCF MODEL RESULTS?

23 A. No, I did not. However, consistent with the Commission's past practice of
24 considering proxy groups which exclude companies whose DCF results do
25 not pass the test of reasonableness,²⁶ I calculated the average and median

26 ²⁶ See, for example, Docket No. E017/GR-15-1033, In the Matter of the Application of Otter Tail Power Company for Authority to Increase Rates for Electric Service in the State of Minnesota, August 16, 2016, at

1 result of the Constant Growth DCF model excluding proxy companies with
2 results below 7.00%.²⁷ Because I did not include the DCF results excluding
3 proxy company results below 7.00% in my calculation of the indicated
4 common equity cost rate for the Utility Proxy Group, the 8.62% average noted
5 above represents a conservative measure of the Utility Proxy Group's ROE.

6
7 Q. PLEASE DESCRIBE YOUR USE OF THE TWO GROWTH DCF APPROACH IN YOUR
8 ANALYSES.

9 A. I also considered the results of the Two Growth DCF approach. Whereas the
10 Constant Growth DCF method assumes a single, Constant Growth rate in
11 perpetuity, the Two Growth DCF approach allows for a near-term growth
12 estimate (the first stage) followed by a long-term "terminal" period growth
13 estimate. This Two Growth approach can moderate the effects of
14 substantially high or low growth rate estimates that may be influenced by near-
15 term events and may not reflect the subject company's expected long-term
16 growth rate. This approach is consistent with the method adopted by the
17 Commission in several prior proceedings and may be applied when the mean
18 growth rate of a particular company is considered unusually high or low
19 relative to the proxy group. In this case, I applied the Two Growth DCF
20 approach to four Utility Proxy Group companies with mean growth rates
21 more than one standard deviation below the overall Utility Proxy Group mean
22 growth rate, and three Utility Proxy Group companies with mean growth rates
23 more than one standard deviation above the overall Utility Proxy Group mean
24 growth rate. The remaining eight Utility Proxy Group companies' growth

11.
27 See, Column 8, page 1 of Exhibit____(DWD-1), Schedule 3.

1 rates were within one standard deviation of the mean Utility Proxy Group
2 growth rate.

3
4 Q. PLEASE EXPLAIN THE BASIS FOR THE GROWTH RATES YOUR APPLY TO THE
5 UTILITY PROXY GROUP IN YOUR TWO GROWTH DCF MODEL.

6 A. If the proxy group company's growth rate fell within the one standard
7 deviation of the mean growth rate of the Utility Proxy Group, that company
8 would have the same growth rate and same indicated ROE in both the
9 Constant Growth and Two Growth DCF models. If the company's growth
10 rate fell outside of one standard deviation of the Utility Proxy Group mean
11 growth rate, I applied those growth rates only to the first five years of the Two
12 Growth DCF analysis. For the second stage (that is, the terminal period of
13 the Two Growth DCF analysis), I used the mean growth rate of all Utility
14 Proxy Group companies with growth rates within one standard deviation of
15 the overall mean growth rate.

16
17 Q. PLEASE SUMMARIZE THE TWO GROWTH DCF MODEL RESULTS.

18 A. As shown on page 2 of Exhibit___(DWD-1), Schedule 3, for the Utility Proxy
19 Group, the application of the Two Growth DCF model to the Utility Proxy
20 Group resulted in indicated ROEs from 7.91% to 9.85%. The mean result of
21 applying the Two Growth DCF model is 8.86%, the median result is 8.76%,
22 and the average of the two is 8.81%. In arriving at a conclusion for the Two
23 Growth DCF-indicated common equity cost rate for the Utility Proxy Group,
24 I relied on an average of the mean and the median results of the DCF.

1 Q. PLEASE SUMMARIZE THE INDICATED ROE USING THE DCF MODEL.

2 A. I averaged the results of the Constant Growth DCF model (8.62%) and Two
3 Growth DCF model (8.81%) to determine the indicated ROE using the DCF
4 model, which is 8.72%.

5
6 **B. The Risk Premium Model**

7 Q. PLEASE DESCRIBE THE THEORETICAL BASIS OF THE RPM.

8 A. The RPM is based on the fundamental financial principle of risk and return;
9 namely, that investors require greater returns for bearing greater risk. The
10 RPM recognizes that common equity capital has greater investment risk than
11 debt capital, as common equity shareholders are behind debt holders in any
12 claim on a company's assets and earnings. As a result, investors require higher
13 returns from common stocks than from bonds to compensate them for
14 bearing the additional risk.

15
16 While it is possible to directly observe bond returns and yields, investors'
17 required common equity returns cannot be directly determined or observed.
18 According to RPM theory, one can estimate a common equity risk premium
19 over bonds (either historically or prospectively), and use that premium to
20 derive a cost rate of common equity. The cost of common equity equals the
21 expected cost rate for long-term debt capital, plus a risk premium over that
22 cost rate, to compensate common shareholders for the added risk of being
23 unsecured and last-in-line for any claim on the corporation's assets and
24 earnings upon liquidation.

1 Q. PLEASE EXPLAIN HOW YOU DERIVED YOUR INDICATED COST OF COMMON
2 EQUITY BASED ON THE RPM.

3 A. To derive my indicated cost of common equity under the RPM, I used two
4 risk premium methods. The first method was the Predictive Risk Premium
5 Model (PRPM) and the second method was a risk premium model using a
6 total market approach. The PRPM estimates the risk-return relationship
7 directly, while the total market approach indirectly derives a risk premium by
8 using known metrics as a proxy for risk.

9
10 *i. Predictive Risk Premium Model*

11 Q. PLEASE EXPLAIN THE PRPM.

12 A. The PRPM, published in the *Journal of Regulatory Economics*,²⁸ was developed
13 from the work of Robert F. Engle, who shared the Nobel Prize in Economics
14 in 2003 “for methods of analyzing economic time series with time-varying
15 volatility” or ARCH.²⁹ Engle found that volatility changes over time and is
16 related from one period to the next, especially in financial markets. Engle
17 discovered that volatility of prices and returns clusters over time and is
18 therefore highly predictable and can be used to predict future levels of risk
19 and risk premiums. That is, historical volatility can be used to predict future
20 volatility, which then can be translated to a predicted equity risk premium.

21
22 The PRPM estimates the risk-return relationship directly, as the predicted
23 equity risk premium is generated by predicting volatility or risk. The PRPM is
24 not based on an estimate of investor behavior, but rather on an evaluation of

28 Pauline M. Ahern, Frank J. Hanley and Richard A. Michelfelder, Ph.D. *A New Approach for Estimating the Equity Risk Premium for Public Utilities*, *The Journal of Regulatory Economics* (December 2011), 40:261-278.

29 Autoregressive conditional heteroscedasticity; *See also*, www.nobelprize.org.

1 the results of that behavior (*i.e.*, the variance of historical equity risk
2 premiums).

3
4 The inputs to the model are the historical returns on the common shares of
5 each Utility Proxy Group company minus the historical monthly yield on long-
6 term U.S. Treasury securities through August 2020. Using a generalized form
7 of ARCH, known as GARCH, I calculated each Utility Proxy Group
8 company's projected equity risk premium using Eviews[®] statistical software.
9 When the GARCH model is applied to the historical return data, it produces
10 a predicted GARCH variance series³⁰ and a GARCH coefficient.³¹ Multiplying
11 the predicted monthly variance by the GARCH coefficient and then
12 annualizing it³² produces the predicted annual equity risk premium. I then
13 added the forecasted 30-year U.S. Treasury bond yield of 2.05%³³ to each
14 company's PRPM-derived equity risk premium to arrive at an indicated cost
15 of common equity. The 30-year U.S. Treasury bond yield is a consensus
16 forecast derived from *Blue Chip Financial Services (Blue Chip)*.³⁴ The mean PRPM
17 indicated common equity cost rate for the Utility Proxy Group is 10.15%, the
18 median is 10.02%, and the average of the two is 10.09%. Consistent with my
19 reliance on the average of the median and mean results of the DCF models, I
20 relied on the average of the mean and median results of the Utility Proxy
21 Group PRPM to calculate a cost of common equity rate of 10.09%.

30 Illustrated on Columns 1 and 2, page 2 of Exhibit____(DWD-1), Schedule 4.

31 Illustrated on Column 4, page 2 of Exhibit____(DWD-1), Schedule 4.

32 Annualized Return = $(1 + \text{Monthly Return})^{12} - 1$

33 See, Column 6, page 2 of Exhibit____(DWD-1), Schedule 4.

34 *Blue Chip Financial Forecasts (Blue Chip)*, June 1, 2020 at page 14 and September 1, 2020 at page 2.

1 Q. PLEASE DESCRIBE YOUR SELECTION OF A RISK-FREE RATE OF RETURN.

2 A. As shown in Exhibit____(DWD-1), Schedules 4 and 5, the risk-free rate
3 adopted for applications of the RPM and CAPM is 2.05%. This risk-free rate
4 is based on the average of the *Blue Chip* consensus forecast of the expected
5 yields on 30-year U.S. Treasury bonds for the six quarters ending with the
6 fourth calendar quarter of 2021, and long-term projections for the years 2022
7 to 2026 and 2027 to 2031.

8
9 Q. WHY DO YOU USE THE PROJECTED 30-YEAR TREASURY YIELD IN YOUR
10 ANALYSES?

11 A. The yield on long-term U.S. Treasury bonds is almost risk-free and its term
12 is consistent with the long-term cost of capital to public utilities measured by
13 the yields on Moody's A-rated public utility bonds; the long-term investment
14 horizon inherent in utilities' common stocks; and the long-term life of the
15 jurisdictional rate base to which the allowed fair rate of return (*i.e.*, cost of
16 capital) will be applied. In contrast, short-term U.S. Treasury yields are more
17 volatile and largely a function of Federal Reserve monetary policy.

18
19 More specifically, the term of the risk-free rate used for cost of capital
20 purposes should match the life (or duration) of the underlying investment (*i.e.*,
21 perpetuity). As noted by Morningstar:

22 The traditional thinking regarding the time horizon of the
23 chosen Treasury security is that it should match the time
24 horizon of whatever is being valued. When valuing a
25 business that is being treated as a going concern, the
26 appropriate Treasury yield should be that of a long-term
27 Treasury bond. Note that the horizon is a function of the
28 investment, not the investor. If an investor plans to hold

1 stock in a company for only five years, the yield on a five-year
2 Treasury note would not be appropriate since the company
3 will continue to exist beyond those five years.³⁵

4 Morin also confirms this when he states:

5 [b]ecause common stock is a long-term investment and
6 because the cash flows to investors in the form of dividends
7 last indefinitely, the yield on very long-term government
8 bonds, namely, the yield on 30-year Treasury bonds, is the
9 best measure of the risk-free rate for use in the CAPM
10 (footnote omitted)... The expected common stock return is
11 based on long-term cash flows, regardless of an individual's
12 holding time period.³⁶

13
14 Pratt and Grabowski recommend a similar approach to selecting the risk-free
15 rate: “[i]n theory, when determining the risk-free rate and the matching ERP
16 you should be matching the risk-free security and the ERP with the period in
17 which the investment cash flows are expected.”³⁷ Similarly, a 2004 paper titled
18 *Applying The Capital Asset Pricing Model* by Robert Harris reviews current
19 practices for application of the CAPM and, when summarizing best current
20 practices, concludes “[t]he risk-free rate should match the tenor of the cash
21 flows being valued.”³⁸

22
23 As a practical matter, equity securities represent a perpetual claim on cash
24 flows; 30-year Treasury bonds are the longest-maturity securities available to
25 approximate that perpetual claim. The average life of NSPM’s utility plant is
26 28 years based on the composite depreciation rate of the components of its

35 Morningstar, Inc., 2013 Ibbotson Stocks, Bonds, Bills and Inflation Valuation Yearbook, at 44.

36 Morin, at 151.

37 Shannon Pratt and Roger Grabowski, Cost of Capital: Applications and Examples, 3rd Ed. (Hoboken, NJ: John Wiley & Sons, Inc., 2008), at 92. “ERP” is the Equity Risk Premium.

38 Paper cited with permission of author.

1 utility plant.³⁹ Thus, the use of a 30-year Treasury bond yield is a more
2 appropriate risk-free rate as it more accurately reflects the life of the assets it
3 finances.

4
5 *ii. Total Market Approach Risk Premium Model*

6 Q. PLEASE EXPLAIN THE TOTAL MARKET APPROACH RPM.

7 A. The total market approach RPM adds a prospective public utility bond yield
8 to an average of: 1) an equity risk premium that is derived from a Beta-adjusted
9 total market equity risk premium, 2) an equity risk premium based on the S&P
10 Utilities Index, and 3) an equity risk premium based on authorized ROEs for
11 electric utilities.

12
13 Q. PLEASE EXPLAIN HOW YOU DETERMINED THE EXPECTED BOND YIELD,
14 APPLICABLE TO THE UTILITY PROXY GROUP.

15 A. The first step in the total market approach RPM analysis is to determine the
16 expected bond yield. Because both ratemaking and the cost of capital,
17 including the common equity cost rate, are prospective in nature, a prospective
18 yield on similarly-rated long-term debt is essential. Because I am unaware of
19 any publication that provides forecasted public utility bond yields, I relied on
20 a consensus forecast of about 50 economists of the expected yield on Aaa-
21 rated corporate bonds for the six calendar quarters ending with the fourth
22 calendar quarter of 2021, and *Blue Chip's* long-term projections for 2022 to
23 2026, and 2027 to 2031. As shown on line 1, page 3 of Exhibit____(DWD-1),
24 Schedule 4, the average expected yield on Moody's Aaa-rated corporate bonds
25 is 2.98%.

39 Average depreciation rate 2021-2023: 3.52%. $1/3.52\% = 28$ years.

1 Because that 2.98% estimate represents a corporate bond yield, and not a
2 utility specific bond yield, I adjusted the expected Aaa-rated corporate bond
3 yield to an equivalent A2-rated public utility bond yield. That resulted in an
4 upward adjustment of 0.58%, which represents a recent spread between Aaa-
5 rated corporate bonds and A2-rated public utility bonds.⁴⁰ Adding that recent
6 0.58% spread to the expected Aaa-rated corporate bond yield of 2.98% results
7 in an expected A2-rated public utility bond yield of 3.56%.

8
9 I then reviewed the average credit rating for the Utility Proxy Group from
10 Moody's to determine if an adjustment to the estimated A2-rated public utility
11 bond was necessary. Since the Utility Proxy Group's average Moody's long-
12 term issuer rating is A3, another adjustment to the expected A2-rated public
13 utility bond is needed to reflect the difference in bond ratings. An upward
14 adjustment of 0.12%, which represents one-third of a recent spread between
15 A2-rated and Baa2-rated public utility bond yields, is necessary to make the
16 A2 prospective bond yield applicable to an A3-rated public utility bond.⁴¹
17 Adding the 0.12% to the 3.56% prospective A2-rated public utility bond yield
18 results in a 3.68% expected bond yield applicable to the Utility Proxy Group.

40 As shown on line 2 and explained in note 2, page 3 of Exhibit____(DWD-1), Schedule 4.

41 As shown on line 4 and explained in note 3, page 3 of Exhibit____(DWD-1), Schedule 4. Moody's does not provide public utility bond yields for A3-rated bonds. As such, it was necessary to estimate the difference between A2-rated and A3-rated public utility bonds. Because there are three steps between Baa2 and A2 (Baa2 to Baa1, Baa1 to A3, and A3 to A2) I assumed an adjustment of one-third of the difference between the A2-rated and Baa2-rated public utility bond yield was appropriate.

Table 4
Summary of the Calculation of the Utility Proxy Group Projected
Bond Yield⁴²

Prospective Yield on Moody's Aaa-Rated Corporate Bonds (<i>Blue Chip</i>)	2.98%
Adjustment to Reflect Yield Spread Between Moody's Aaa-Rated Corporate Bonds and Moody's A2-Rated Utility Bonds	0.58%
Adjustment to Reflect the Utility Proxy Group's Average Moody's Bond Rating of A3	<u>0.12%</u>
Prospective Bond Yield Applicable to the Utility Proxy Group	<u>3.68%</u>

To develop the total market approach RPM estimate of the appropriate return on equity, this prospective bond yield is then added to the average of the three different equity risk premiums, which I now discuss, in turn.

a. Beta Coefficient Derived Equity Risk Premium

Q. PLEASE EXPLAIN HOW THE BETA-DERIVED EQUITY RISK PREMIUM IS DETERMINED.

A. The components of the Beta-derived risk premium model are: 1) an expected market equity risk premium over corporate bonds, and 2) the Beta coefficient. The derivation of the Beta-derived equity risk premium that I applied to the Utility Proxy Group is shown on lines 1 through 9, page 8 of Exhibit____(DWD-1), Schedule 4. The total Beta-derived equity risk premium I applied is based on an average of three historical market data-based equity risk premiums, two *Value Line*-based equity risk premiums, and a Bloomberg-based equity risk premium. Each of these is described below.

42 As shown on page 3 of Exhibit____(DWD-1), Schedule 4.

1 Q. HOW DID YOUR DERIVE A MARKET EQUITY RISK PREMIUM BASED ON LONG-
2 TERM HISTORICAL DATA?

3 A. To derive an historical market equity risk premium, I used the most recent
4 holding period returns for the large company common stocks from the Stocks,
5 Bonds, Bills, and Inflation (SBBI) Yearbook 2020 (SBBI - 2020)⁴³ less the
6 average historical yield on Moody's Aaa/Aa-rated corporate bonds for the
7 period 1928 to 2019. Using holding period returns over a very long time is
8 appropriate because it is consistent with the long-term investment horizon
9 presumed by investing in a going concern, *i.e.*, a company expected to operate
10 in perpetuity.

11
12 SBBI's long-term arithmetic mean monthly total return rate on large company
13 common stocks was 11.83% and the long-term arithmetic mean monthly yield
14 on Moody's Aaa/Aa-rated corporate bonds was 6.05%.⁴⁴ As shown on line 1,
15 page 8 of Exhibit____(DWD-1), Schedule 4, subtracting the mean monthly
16 bond yield from the total return on large company stocks results in a long-
17 term historical equity risk premium of 5.78%.

18
19 I used the arithmetic mean monthly total return rates for the large company
20 stocks and yields (income returns) for the Moody's Aaa/Aa corporate bonds,
21 because they are appropriate for the purpose of estimating the cost of capital
22 as noted in SBBI - 2020.⁴⁵ Using the arithmetic mean return rates and yields
23 is appropriate because historical total returns and equity risk premiums

43 See, SBBI-2020 Appendix A Tables: Morningstar Stocks, Bonds, Bills, & Inflation 1926-2019.

44 As explained in note 1, page 9 of Exhibit____(DWD-1), Schedule 4.

45 See, SBBI - 2020, at page 10-22.

1 provide insight into the variance and standard deviation of returns needed by
2 investors in estimating future risk when making a current investment. If
3 investors relied on the geometric mean of historical equity risk premiums, they
4 would have no insight into the potential variance of future returns, because
5 the geometric mean relates the change over many periods to a constant rate
6 of change, thereby obviating the year-to-year fluctuations, or variance, which
7 is critical to risk analysis.

8
9 Q. PLEASE EXPLAIN THE DERIVATION OF THE REGRESSION-BASED MARKET
10 EQUITY RISK PREMIUM.

11 A. To derive the regression-based market equity risk premium of 9.39% shown
12 on line 2, page 8 of Exhibit____(DWD-1), Schedule 4, I used the same monthly
13 annualized total returns on large company common stocks relative to the
14 monthly annualized yields on Moody's Aaa/Aa-rated corporate bonds as
15 mentioned above. I modeled the relationship between interest rates and the
16 market equity risk premium using the observed monthly market equity risk
17 premium as the dependent variable, and the monthly yield on Moody's
18 Aaa/Aa-rated corporate bonds as the independent variable. I then used a
19 linear Ordinary Least Squares ("OLS") regression, in which the market equity
20 risk premium is expressed as a function of the Moody's Aaa/Aa-rated
21 corporate bonds yield:

$$RP = \alpha + \beta (R_{Aaa/Aa})$$

22
23 Q. PLEASE EXPLAIN THE DERIVATION OF THE PRPM EQUITY RISK PREMIUM.

24 A. I used the same PRPM approach described above to the PRPM equity risk
25 premium. The inputs to the model are the historical monthly returns on large

1 company common stocks minus the monthly yields on Moody's Aaa/Aa-rated
2 corporate bonds during the period from January 1928 through August 2020.⁴⁶
3 Using the previously discussed generalized form of ARCH, known as
4 GARCH, the projected equity risk premium is determined using Eviews®
5 statistical software. The resulting PRPM predicted a market equity risk
6 premium of 9.62%.⁴⁷

7
8 Q. PLEASE EXPLAIN THE DERIVATION OF A PROJECTED EQUITY RISK PREMIUM
9 BASED ON *VALUE LINE* DATA FOR YOUR RPM ANALYSIS.

10 A. As noted above, because both ratemaking and the cost of capital are
11 prospective, a prospective market equity risk premium is needed. The
12 derivation of the forecasted or prospective market equity risk premium can be
13 found in note 4, page 9 of Exhibit____(DWD-1), Schedule 4. Consistent with
14 my calculation of the dividend yield component in my DCF analysis, this
15 prospective market equity risk premium is derived from an average of the
16 three- to five-year median market price appreciation potential by *Value Line*
17 for the 13 weeks ended September 4, 2020, plus an average of the median
18 estimated dividend yield for the common stocks of the 1,700 firms covered in
19 *Value Line*.⁴⁸

20
21 The average median expected price appreciation is 58%, which translates to a
22 12.12% annual appreciation, and, when added to the average of *Value Line's*
23 median expected dividend yields of 2.33%, equates to a forecasted annual total
24 return rate on the market of 14.45%. The forecasted Moody's Aaa-rated

46 Data from January 1926 to December 2019 is from SBBI - 2020. Data from January 2020 to August 2020 is from Bloomberg.

47 Shown on line 3, page 8 of Exhibit____(DWD-1), Schedule 4.

48 As explained in detail in note 1, page 2 of Exhibit____(DWD-1), Schedule 4.

1 corporate bond yield of 2.98% is deducted from the total market return of
2 14.45%, resulting in an equity risk premium of 11.47%, as shown on line 4,
3 page 8 of Exhibit____(DWD-1), Schedule 4.
4

5 Q. PLEASE EXPLAIN THE DERIVATION OF AN EQUITY RISK PREMIUM BASED ON
6 THE S&P 500 COMPANIES.

7 A. Using data from *Value Line*, I calculated an expected total return on the S&P
8 500 companies using expected dividend yields and long-term growth estimates
9 as a proxy for capital appreciation. The expected total return for the S&P 500
10 is 13.83%. Subtracting the prospective yield on Moody's Aaa-rated corporate
11 bonds of 2.98% results in a 10.85% projected equity risk premium.
12

13 Q. PLEASE EXPLAIN THE DERIVATION OF AN EQUITY RISK PREMIUM BASED ON
14 BLOOMBERG DATA.

15 A. Using data from Bloomberg, I calculated an expected total return on the S&P
16 500 using expected dividend yields and long-term growth estimates as a proxy
17 for capital appreciation, identical to the method described above. The
18 expected total return for the S&P 500 is 13.78%. Subtracting the prospective
19 yield on Moody's Aaa-rated corporate bonds of 2.98% results in a 10.80%
20 projected equity risk premium.
21

22 Q. WHAT IS YOUR CONCLUSION OF A BETA-DERIVED EQUITY RISK PREMIUM FOR
23 USE IN YOUR RPM ANALYSIS?

24 A. I gave equal weight to all six equity risk premiums based on each source -
25 historical, *Value Line*, and Bloomberg - in arriving at a 9.65% equity risk
26 premium.

Table 5
Summary of the Calculation of the Equity Risk Premium Using Total
Market Returns⁴⁹

Historical Spread Between Total Returns of Large Stocks and Aaa and Aa-Rated Corporate Bond Yields (1928 – 2019)	5.78%
Regression Analysis on Historical Data	9.39%
PRPM Analysis on Historical Data	9.62%
Prospective Equity Risk Premium using Total Market Returns from <i>Value Line</i> Summary & Index less Projected Aaa Corporate Bond Yields	11.47%
Prospective Equity Risk Premium using Measures of Capital Appreciation and Income Returns from <i>Value Line</i> for the S&P 500 less Projected Aaa Corporate Bond Yields	10.85%
Prospective Equity Risk Premium using Measures of Capital Appreciation and Income Returns from Bloomberg Professional Services for the S&P 500 less Projected Aaa Corporate Bond Yields	<u>10.80%</u>
Average	<u>9.65%</u>

After calculating the average market equity risk premium of 9.65%, I adjusted it by the Beta coefficient to account for the risk of the Utility Proxy Group. As discussed below, the Beta coefficient is a meaningful measure of prospective relative risk to the market as a whole, and is a logical way to allocate a company's, or proxy group's, share of the market's total equity risk premium relative to corporate bond yields. As shown on page 1 of Exhibit____(DWD-1), Schedule 5, the average of the mean and median Beta coefficient for the Utility Proxy Group is 0.94. Multiplying the 0.94 average

⁴⁹ As shown on page 8 of Exhibit____(DWD-1), Schedule 4.

Beta coefficient by the market equity risk premium of 9.65% results in a Beta-adjusted equity risk premium for the Utility Proxy Group of 9.07%.

b. S&P Utility Index Derived Equity Risk Premium

Q. HOW DID YOU DERIVE THE EQUITY RISK PREMIUM BASED ON THE S&P UTILITY INDEX AND MOODY'S A-RATED PUBLIC UTILITY BONDS?

A. I estimated three equity risk premiums based on S&P Utility Index holding period returns, and two equity risk premiums based on the expected returns of the S&P Utilities Index, using *Value Line* and Bloomberg data, respectively. Turning first to the S&P Utility Index holding period returns, I derived a long-term monthly arithmetic mean equity risk premium between the S&P Utility Index total returns of 10.74% and monthly Moody's A-rated public utility bond yields of 6.53% from 1928 to 2019 to arrive at an equity risk premium of 4.21%.⁵⁰ I then used the same historical data to derive an equity risk premium of 6.83% based on a regression of the monthly equity risk premiums. The final S&P Utility Index holding period equity risk premium involved applying the PRPM using the historical monthly equity risk premiums from January 1928 to August 2020 to arrive at a PRPM-derived equity risk premium of 5.53% for the S&P Utility Index.

I then derived expected total returns on the S&P Utilities Index of 10.36% and 11.45% using data from *Value Line* and Bloomberg, respectively, and subtracted the prospective Moody's A2-rated public utility bond yield of 3.56%⁵¹, which resulted in equity risk premiums of 6.80% and 7.89%, respectively. As with the market equity risk premiums, I averaged each risk

⁵⁰ As shown on line 1, page 12 of Exhibit___(DWD-1), Schedule 4.

⁵¹ Derived on line 3, page 3 of Exhibit___(DWD-1), Schedule 4.

premium based on each source (*i.e.*, historical, *Value Line*, and Bloomberg) to arrive at my utility-specific equity risk premium of 6.25%.

Table 6
Summary of the Calculation of the Equity Risk Premium Using S&P
Utility Index Holding Returns⁵²

Historical Spread Between Total Returns of the S&P Utilities Index and A2-Rated Utility Bond Yields (1928 – 2019)	4.21%
Regression Analysis on Historical Data	6.83%
PRPM Analysis on Historical Data	5.53%
Prospective Equity Risk Premium Using Measures of Capital Appreciation and Income Returns from <i>Value Line</i> for the S&P Utilities Index Less Projected A2 Utility Bond Yields	6.80%
Prospective Equity Risk Premium Using Measures of Capital Appreciation and Income Returns from Bloomberg Professional Services for the S&P Utilities Index Less Projected A2 Utility Bond Yields	<u>7.89%</u>
Average	<u>6.25%</u>

c. Authorized Return Derived Equity Risk Premium

Q. HOW DO YOU DERIVE AN EQUITY RISK PREMIUM OF 5.92% BASED ON AUTHORIZED ROES FOR ELECTRIC UTILITIES?

A. The equity risk premium of 5.92% shown on line 3, page 7 of Exhibit____(DWD-1), Schedule 4 is the result of a regression analysis based on regulatory awarded ROEs related to the yields on Moody's A-rated public utility bonds. That analysis is shown on page 13 of Exhibit____(DWD-1),

⁵² As shown on page 12 of Exhibit____(DWD-1), Schedule 4.

1 Schedule 4. Page 13 of Exhibit____(DWD-1), Schedule 4 contains the
2 graphical results of a regression analysis of 1,168 rate cases for electric utilities
3 which were fully litigated during the period from January 1, 1980 through
4 August 31, 2020. It shows the implicit equity risk premium relative to the
5 yields on A2-rated public utility bonds immediately prior to the issuance of
6 each regulatory decision. That is, the analysis considers the relationship
7 between authorized returns and prevailing public utility bond yields at the time
8 of the decision.

9
10 It is readily discernible that there is an inverse relationship between the yield
11 on A2-rated public utility bonds and equity risk premiums. In other words, as
12 interest rates decline, the equity risk premium rises and vice versa, a result
13 consistent with financial literature on the subject.⁵³ I used the regression
14 results to estimate the equity risk premium applicable to the projected yield on
15 Moody's A2-rated public utility bonds. Given the expected A2-rated utility
16 bond yield of 3.56%, it can be calculated that the indicated equity risk premium
17 applicable to that bond yield is 5.80%, which is shown on line 3, page 7 of
18 Exhibit____(DWD-1), Schedule 4.

19
20 Q. WHAT IS YOUR CONCLUSION OF AN EQUITY RISK PREMIUM FOR USE IN YOUR
21 TOTAL MARKET APPROACH RPM ANALYSIS?

22 A. The equity risk premium I apply to the Utility Proxy Group is 7.08%, which
23 is the average of the Beta-adjusted equity risk premiums for the Utility Proxy

53 See, e.g., Robert S. Harris and Felicia C. Marston, *The Market Risk Premium: Expectational Estimates Using Analysts' Forecasts*, *Journal of Applied Finance*, Vol. 11, No. 1, 2001, at 11-12; Eugene F. Brigham, Dilip K. Shome, and Steve R. Vinson, *The Risk Premium Approach to Measuring a Utility's Cost of Equity*, *Financial Management*, Spring 1985, at 33-45.

Group, the S&P Utilities Index, and the authorized return utility equity risk premiums of 9.07%, 6.25%, and 5.92%, respectively.⁵⁴

Q. WHAT IS THE INDICATED RPM COMMON EQUITY COST RATE BASED ON THE TOTAL MARKET APPROACH?

A. As shown on line 7, page 3 of Exhibit____(DWD-1), Schedule 4 and shown on Table 7, below, I calculated a common equity cost rate of 10.76% for the Utility Proxy Group based on the total market approach RPM.

Table 7

Summary of the Total Market Return Risk Premium Model⁵⁵

Prospective Moody's A3-Rated Utility Bond Applicable to the Utility Proxy Group	3.68%
Prospective Equity Risk Premium	<u>7.08%</u>
Indicated Cost of Common Equity	<u>10.76%</u>

Q. WHAT ARE THE RESULTS OF YOUR APPLICATION OF THE PRPM AND THE TOTAL MARKET APPROACH RPM?

A. As shown on page 1 of Exhibit____(DWD-1), Schedule 4, the indicated RPM-derived common equity cost rate is 10.43%, which gives equal weight to the PRPM (10.09%) and the adjusted-market approach results (10.76%).

54 As shown on page 7 of Exhibit____(DWD-1), Schedule 4.

55 As shown on page 3 of Exhibit____(DWD-1), Schedule 4.

C. The Capital Asset Pricing Model

Q. PLEASE EXPLAIN THE THEORETICAL BASIS OF THE CAPM.

A. CAPM theory defines risk as the co-variability of a security's returns with the market's returns as measured by the Beta coefficient (β). A Beta coefficient less than 1.0 indicates lower variability than the market as a whole, while a Beta coefficient greater than 1.0 indicates greater variability than the market.

The CAPM assumes that all non-market or unsystematic risk can be eliminated through diversification. The risk that cannot be eliminated through diversification is called market, or systematic, risk. In addition, the CAPM presumes that investors only require compensation for systematic risk, which is the result of macroeconomic and other events that affect the returns on all assets. The model is applied by adding a risk-free rate of return to a market risk premium, which is adjusted proportionately to reflect the systematic risk of the individual security relative to the total market as measured by the Beta coefficient. The traditional CAPM model is expressed as:

	R_s	=	$R_f + \beta (R_m - R_f)$
Where:	R_s	=	Return rate on the common stock
	R_f	=	Risk-free rate of return
	R_m	=	Return rate on the market as a whole
	β	=	Adjusted Beta coefficient (volatility of the security relative to the market as a whole)

Numerous tests of the traditional CAPM have measured the extent to which security returns and Beta coefficients are related as predicted by the CAPM, confirming its validity. The empirical CAPM (ECAPM) reflects the reality that while the results of these tests support the notion that the Beta coefficient is related to security returns, the empirical Security Market Line (SML)

described by the CAPM formula is not as steeply sloped as the predicted SML.⁵⁶

In their work on the CAPM, Fama and French clearly state regarding Figure 2, below, that “[t]he returns on the low beta portfolios are too high, and the returns on the high beta portfolios are too low.”⁵⁷

Figure 2 <http://pubs.aeaweb.org/doi/pdfplus/10.1257/0895330042162430>

Average Annualized Monthly Return versus Beta for Value Weight Portfolios Formed on Prior Beta, 1928–2003

In addition, Morin observes that while the results of these tests support the notion that Beta is related to security returns, the empirical SML described by the CAPM formula is not as steeply sloped as the predicted SML. Morin states:

With few exceptions, the empirical studies agree that ... low-beta securities earn returns somewhat higher than the CAPM

⁵⁶ Morin, at 175.

⁵⁷ Eugene F. Fama and Kenneth R. French, *The Capital Asset Pricing Model: Theory and Evidence*, Journal of Economic Perspectives, Vol. 18, No. 3, Summer 2004 at 33 ("Fama & French").

would predict, and high-beta securities earn less than predicted.⁵⁸

* * *

Therefore, the empirical evidence suggests that the expected return on a security is related to its risk by the following approximation:

$$K = R_F + x (R_M - R_F) + (1-x) \beta(R_M - R_F)$$

where x is a fraction to be determined empirically. The value of x that best explains the observed relationship [is] Return = 0.0829 + 0.0520 β is between 0.25 and 0.30. If x = 0.25, the equation becomes:

$$K = R_F + 0.25(R_M - R_F) + 0.75 \beta(R_M - R_F)^{59}$$

Fama and French provide similar support for the ECAPM when they state:

The early tests firmly reject the Sharpe-Lintner version of the CAPM. There is a positive relation between beta and average return, but it is too 'flat.'... The regressions consistently find that the intercept is greater than the average risk-free rate... and the coefficient on beta is less than the average excess market return... This is true in the early tests... as well as in more recent cross-section regressions tests, like Fama and French (1992).⁶⁰

Finally, Fama and French further note:

Confirming earlier evidence, the relation between beta and average return for the ten portfolios is much flatter than the Sharpe-Linter CAPM predicts. The returns on low beta portfolios are too high, and the returns on the high beta portfolios are too low. For example, the predicted return on the portfolio with the lowest beta is 8.3 percent per year; the

58 Morin, at 175.

59 Morin, at 190.

60 Fama & French, at 32.

1 actual return as 11.1 percent. The predicted return on the
2 portfolio with the t beta is 16.8 percent per year; the actual is
3 13.7 percent.⁶¹
4

5 Clearly, the justification from Morin, Fama, and French, along with their
6 reviews of other academic research on the CAPM, validate the use of the
7 ECAPM. In view of theory and practical research, I have applied both the
8 traditional CAPM and the ECAPM to the companies in the Utility Proxy
9 Group and averaged the results.
10

11 Q. WHAT BETA COEFFICIENTS DID YOU USE IN YOUR CAPM ANALYSIS?

12 A. For the Beta coefficients in my CAPM analysis, I considered two sources:
13 *Value Line* and Bloomberg Professional Services. While both of those services
14 adjust their calculated (or “raw”) Beta coefficients to reflect the tendency of
15 the Beta coefficient to regress to the market mean of 1.00, *Value Line*
16 calculates the Beta coefficient over a five-year period, while Bloomberg
17 calculates it over a two-year period.
18

19 Q. PLEASE DESCRIBE YOUR SELECTION OF A RISK-FREE RATE OF RETURN.

20 A. As discussed previously, the risk-free rate adopted for both applications of the
21 CAPM is 2.05%. This risk-free rate is based on the average of the *Blue Chip*
22 consensus forecast of the expected yields on 30-year U.S. Treasury bonds for
23 the six quarters ending with the fourth calendar quarter of 2021, and long-
24 term projections for the years 2022 to 2026 and 2027 to 2031.
25

61 *Ibid.*, at 33.

1 Q. PLEASE EXPLAIN THE ESTIMATION OF THE EXPECTED RISK PREMIUM FOR THE
2 MARKET USED IN YOUR CAPM ANALYSES.

3 A. The basis of the market risk premium is explained in detail in note 1 on
4 Exhibit____(DWD-1), Schedule 5. As discussed above, the market risk
5 premium is derived from an average of three historical data-based market risk
6 premiums, two *Value Line* data-based market risk premiums, and one
7 Bloomberg data-based market risk premium.

8
9 The long-term income return on U.S. Government securities of 5.09% was
10 deducted from the SBBI - 2020 monthly historical total market return of
11 12.10%, which results in an historical market equity risk premium of 7.01%.⁶²
12 I applied a linear OLS regression to the monthly annualized historical returns
13 on the S&P 500 relative to historical yields on long-term U.S. Government
14 securities from SBBI - 2020. That regression analysis yielded a market equity
15 risk premium of 10.24%. The PRPM market equity risk premium is 10.73%,
16 and is derived using the PRPM relative to the yields on long-term U.S.
17 Treasury securities from January 1926 through August 2020.

18
19 The *Value Line*-derived forecasted total market equity risk premium is derived
20 by deducting the forecasted risk-free rate of 2.05%, discussed above, from the
21 *Value Line* projected total annual market return of 14.45%, resulting in a
22 forecasted total market equity risk premium of 12.40%. The S&P 500
23 projected market equity risk premium using *Value Line* data is derived by
24 subtracting the projected risk-free rate of 2.05% from the projected total

62 SBBI - 2020, at Appendix A-1 (1) through A-1 (3) and Appendix A-7 (19) through A-7 (21).

1 return of the S&P 500 of 13.83%. The resulting market equity risk premium
2 is 11.78%.

3
4 The S&P 500 projected market equity risk premium using Bloomberg data is
5 derived by subtracting the projected risk-free rate of 2.05% from the projected
6 total return of the S&P 500 of 13.78%. The resulting market equity risk
7 premium is 11.73%. These six measures, when averaged, result in an average
8 total market equity risk premium of 10.65%.

Table 8
Summary of the Calculation of the Market Risk Premium for Use in
the CAPM⁶³

Historical Spread Between Total Returns of Large Stocks and Long-Term Government Bond Yields (1926 – 2019)	7.01%
Regression Analysis on Historical Data	10.24%
PRPM Analysis on Historical Data	10.73%
Prospective Equity Risk Premium Using Total Market Returns from <i>Value Line</i> Summary & Index Less Projected 30-Year Treasury Bond Yields	12.40%
Prospective Equity Risk Premium Using Measures of Capital Appreciation and Income Returns from <i>Value Line</i> for the S&P 500 Less Projected 30-Year Treasury Bond Yields	11.78%
Prospective Equity Risk Premium using Measures of Capital Appreciation and Income Returns from Bloomberg Professional Services for the S&P 500 less Projected 30-Year Treasury Bond Yields	<u>11.73%</u>
Average	<u><u>10.65%</u></u>

Q. WHAT ARE THE RESULTS OF YOUR APPLICATION OF THE TRADITIONAL AND EMPIRICAL CAPM TO THE UTILITY PROXY GROUP?

A. As shown on page 1 of Exhibit___(DWD-1), Schedule 5, the mean result of my CAPM/ECAPM analyses is 12.32%, the median is 11.95%, and the average of the two is 12.14%. Consistent with my reliance on the average of mean and median DCF results discussed above, the indicated common equity cost rate using the CAPM/ECAPM is 12.14%.

⁶³ As shown on page 2 of Exhibit___(DWD-1), Schedule 5.

1 **D. Common Equity Cost Rates for a Proxy Group of Domestic,**
2 **Non-Price Regulated Companies Based on the DCF, RPM, and**
3 **CAPM**

4 Q. WHY DO YOU ALSO CONSIDER A PROXY GROUP OF DOMESTIC, NON-PRICE
5 REGULATED COMPANIES?

6 A. Although I am not an attorney, my interpretation of the *Hope* and *Bluefield*
7 cases is that they did not specify that comparable risk companies had to be
8 utilities. Since the purpose of rate regulation is to be a substitute for
9 marketplace competition, non-price regulated firms operating in the
10 competitive marketplace make an excellent proxy if they are comparable in
11 total risk to the Utility Proxy Group being used to estimate the cost of
12 common equity. The selection of such domestic, non-price regulated
13 competitive firms theoretically and empirically results in a proxy group which
14 is comparable in total risk to the Utility Proxy Group, since all of these
15 companies compete for capital in the exact same markets.

16
17 Q. HOW DID YOU SELECT NON-PRICE REGULATED COMPANIES THAT ARE
18 COMPARABLE IN TOTAL RISK TO THE UTILITY PROXY GROUP?

19 A. In order to select a proxy group of domestic, non-price regulated companies
20 similar in total risk to the Utility Proxy Group, I relied on the Beta coefficients
21 and related statistics derived from *Value Line* regression analyses of weekly
22 market prices over the most recent 260 weeks (*i.e.*, five years). These selection
23 criteria resulted in a proxy group of 47 domestic, non-price regulated firms
24 comparable in total risk to the Utility Proxy Group. Total risk is the sum of
25 non-diversifiable market risk and diversifiable company-specific risks. The
26 criteria used in selecting the domestic, non-price regulated firms was:

27 (i) They must be covered by *Value Line* (Standard Edition);

- 1 (ii) They must be domestic, non-price regulated companies, *i.e.*, not
2 utilities;
- 3 (iii) Their Beta coefficients must lie within plus or minus two standard
4 deviations of the average unadjusted Beta coefficients of the Utility
5 Proxy Group; and
- 6 (iv) The residual standard errors of the *Value Line* regressions which gave
7 rise to the unadjusted Beta coefficients must lie within plus or minus
8 two standard deviations of the average residual standard error of the
9 Utility Proxy Group.

10

11 Beta coefficients measure market, or systematic, risk, which is not
12 diversifiable. The residual standard errors of the regressions measure each
13 firm's company-specific, diversifiable risk. Companies that have similar Beta
14 coefficients and similar residual standard errors resulting from the same
15 regression analyses have similar total investment risk.

16

17 Q. HAVE YOU PREPARED A SCHEDULE WHICH SHOWS THE DATA FROM WHICH
18 YOU SELECTED THE 47 DOMESTIC, NON-PRICE REGULATED COMPANIES THAT
19 ARE COMPARABLE IN TOTAL RISK TO THE UTILITY PROXY GROUP?

20 A. Yes, the basis of my selection and both proxy groups' regression statistics are
21 shown in Exhibit____(DWD-1), Schedule 6.

22

23 Q. DID YOU CALCULATE COMMON EQUITY COST RATES USING THE DCF MODEL,
24 RPM, AND CAPM FOR THE NON-PRICE REGULATED PROXY GROUP?

25 A. Yes. Because the DCF model, RPM, and CAPM have been applied in an
26 identical manner as described above, I will not repeat the details of the

1 rationale and application of each model. One exception is in the application
2 of the RPM, where I did not use public utility-specific equity risk premiums,
3 nor did I apply the PRPM to the individual non-price regulated companies.
4

5 Pages 2 and 3 of Exhibit____(DWD-1), Schedule 7 applies the Constant
6 Growth and Two Growth DCF models to the Non-Price Regulated Proxy
7 Group. As shown, the indicated common equity cost rates are 11.95% and
8 11.87%, respectively, averaging 11.91%.
9

10 Pages 4 through 6 of Exhibit____(DWD-1), Schedule 7 contain the data and
11 calculations that support the 12.68% RPM common equity cost rate. As
12 shown on line 1, page 3 of Exhibit____(DWD-1), Schedule 7, the consensus
13 prospective yield on Moody's Baa-rated corporate bonds for the six quarters
14 ending in the fourth quarter of 2021, and for the years 2022 to 2026 and 2027
15 to 2031, is 4.10%.⁶⁴ Since the Non-Price Regulated Proxy Group has an
16 average Moody's long-term issuer rating of Baa1, a downward adjustment of
17 0.20% to the projected Baa2 rated corporate bond yield is necessary to reflect
18 the difference in ratings which results in a projected Baa1-rated corporate
19 bond yield of 3.90%.
20

21 When the Beta-adjusted risk premium of 8.78%⁶⁵ relative to the Non-Price
22 Regulated Proxy Group is added to the prospective A3-rated corporate bond
23 yield of 3.90%, the indicated RPM common equity cost rate is 12.68%.

64 *Blue Chip*, June 1, 2020, at page 14 and September 1, 2020, at page 2.

65 Derived on page 5 of Exhibit____(DWD-1), Schedule 7.

Page 6 of Exhibit____(DWD-1), Schedule 7 contains the inputs and calculations that support my indicated CAPM/ECAPM common equity cost rate of 11.83%.

Q. HOW IS THE COST RATE OF COMMON EQUITY BASED ON THE NON-PRICE REGULATED PROXY GROUP COMPARABLE IN TOTAL RISK TO THE UTILITY PROXY GROUP?

A. As shown on page 1 of Exhibit____(DWD-1), Schedule 7, the results of the common equity models applied to the Non-Price Regulated Proxy Group -- which is comparable in total risk to the Utility Proxy Group -- are as follows: 11.91% (DCF), 12.68% (RPM), and 11.83% (CAPM). The average of the mean and median of these models is 12.03%, which I used as the indicated common equity cost rates for the Non-Price Regulated Proxy Group.

VII. CONCLUSION OF COMMON EQUITY COST ANALYTICAL RESULTS BEFORE ADJUSTMENTS

Q. BASED ON YOUR ANALYSES, WHAT IS THE INDICATED COMMON EQUITY COST RATE BEFORE ADJUSTMENTS?

A. By applying multiple cost of common equity models to the Utility Proxy Group and the Non-Price Regulated Proxy Group, the indicated range of common equity cost rates attributable to the Utility Proxy Group before any relative risk adjustments is between 9.73% and 10.83%. I used multiple cost of common equity models as primary tools in arriving at my recommended common equity cost rate, because each of these models is theoretically sound and available to investors and because no single model is so inherently precise that it can be relied on to the exclusion of other theoretically sound models.

1 Using multiple models adds reliability to the estimated common equity cost
2 rate, with the prudence of using multiple cost of common equity models
3 supported in both the financial literature and regulatory precedent.
4

5 Based on these common equity cost results, I conclude that a range of
6 common equity cost rates between 9.77% and 10.83% is reasonable and
7 appropriate before any adjustments for relative risk differences between the
8 Company and the Utility Proxy Group are made. The bottom of the indicated
9 range (*i.e.*, 9.77%) was calculated by averaging the average of all model results
10 (10.83%) with the lowest model result (8.72%), and the top of the indicated
11 range is the approximate average of all model results. I have chosen this
12 indicated range of common equity cost rates applicable to the Utility Proxy
13 Group as a conservative estimate of the required return on equity.
14

15 Q. WHY DID YOU USE THE MIDPOINT BETWEEN YOUR AVERAGE MODEL RESULT
16 AND YOUR LOWEST MODEL RESULT AS THE BOTTOM OF YOUR INDICATED
17 REASONABLE RANGE BEFORE ADJUSTMENT?

18 A. As explained in detail in Section IX below, the COVID-19 pandemic has
19 created turmoil in the markets. Key takeaways include:

- 20 • The full impact and duration of the COVID-19 pandemic are
21 unknown, and outcomes are still highly uncertain;
22
- 23 • This uncertainty increases volatility. Volatility increases the
24 chances of investment losses. As a result, investors flee to bonds
25 to limit their investment losses, which is known as “the flight to
26 safety.” Increased levels of bond purchases increase their price,
27 and drive down their yields, *i.e.*, interest rates. Because of this,
28 the current low-interest rate environment is due to increased

1 volatility in the market, and not a steady lowering of the cost of
2 debt over time; and
3

- 4 • The same increased market volatility that caused investors'
5 “flight to safety” also created a situation where utilities are traded
6 similar to the S&P 500. These correlated returns of utility stocks
7 and market indices increase Beta coefficients (a measure of risk),
8 and by extension, investor-required returns.
9

10 While the current volatility and uncertainty could justify a higher return on
11 equity, my recommendation to use the lower end of the range of my results
12 for my Utility Proxy Group reasonable range is designed to provide a
13 conservative estimate of the Company’s required return.
14

15 **VIII. ADJUSTMENTS TO THE COMMON EQUITY COST RATE**

16

17 **A. Size Adjustment**

18 Q. DOES THE COMPANY’S SMALLER SIZE RELATIVE TO THE UTILITY PROXY
19 GROUP COMPANIES INCREASE ITS BUSINESS RISK?

20 A. Yes. As a preliminary matter, because I have developed my cost of common
21 equity recommendation for the Company’s Minnesota operations based on
22 market data applied to the Utility Proxy Group of risk-comparable companies,
23 in order to assess the Company’s risk associated with its relative small size of
24 its Minnesota operations, it is necessary to compare the Company’s
25 Minnesota-jurisdictional size relative to the Utility Proxy Group. The
26 Company’s smaller size relative to the Utility Proxy Group companies
27 indicates greater relative business risk for the Company because, all else being
28 equal, size has a material bearing on risk.

1 Size affects business risk because smaller companies generally are less able to
2 cope with significant events that affect sales, revenues and earnings. For
3 example, smaller companies face more risk exposure to business cycles and
4 economic conditions, both nationally and locally. Additionally, the loss of
5 revenues from a few larger customers would have a greater effect on a small
6 company than on a bigger company with a larger, more diverse, customer
7 base. This is true for utilities, as well as for non-regulated companies.

8
9 As further evidence that smaller firms are riskier, investors generally demand
10 greater returns from smaller firms to compensate for less marketability and
11 liquidity of their securities. Duff & Phelps' 2020 Valuation Handbook – U.S.
12 Guide to Cost of Capital (D&P - 2020) discusses the nature of the small-size
13 phenomenon, providing an indication of the magnitude of the size premium
14 based on several measures of size. In discussing “Size as a Predictor of Equity
15 Returns,” D&P - 2020 states:

16 The size effect is based on the empirical observation that
17 companies of smaller size are associated with greater risk and,
18 therefore, have greater cost of capital [sic]. The “size” of a
19 company is one of the most important risk elements to
20 consider when developing cost of equity capital estimates for
21 use in valuing a business simply because size has been shown
22 to be a *predictor* of equity returns. In other words, there is a
23 significant (negative) relationship between size and historical
24 equity returns - as size *decreases*, returns tend to *increase*, and
25 vice versa. (footnote omitted) (emphasis in original)⁶⁶

66 Duff & Phelps Valuation Handbook – U.S. Guide to Cost of Capital, Wiley 2020, at 4-1.

1 Furthermore, in “The Capital Asset Pricing Model: Theory and Evidence,”
2 Fama and French note size is indeed a risk factor which must be reflected
3 when estimating the cost of common equity. On page 14, they note:

4 . . . the higher average returns on small stocks and high
5 book-to-market stocks reflect unidentified state variables that
6 produce undiversifiable risks (covariances) in returns not
7 captured in the market return and are priced separately from
8 market betas.⁶⁷

9
10 Based on this evidence, Fama and French proposed their three-factor model
11 which includes a size variable in recognition of the effect size has on the cost
12 of common equity.

13
14 Also, it is a basic financial principle that the use of funds invested, and not the
15 source of funds, is what gives rise to the risk of any investment.⁶⁸ Eugene
16 Brigham, a well-known authority, states:

17 A number of researchers have observed that portfolios of
18 small-firms (sic) have earned consistently higher average
19 returns than those of large-firm stocks; this is called the
20 “small-firm effect.” On the surface, it would seem to be
21 advantageous to the small firms to provide average returns in
22 a stock market that are higher than those of larger firms. In
23 reality, it is bad news for the small firm; **what the small-firm**
24 **effect means is that the capital market demands higher**
25 **returns on stocks of small firms than on otherwise**
26 **similar stocks of the large firms.** (emphasis added)⁶⁹

67 Fama & French, at 25-43.

68 Richard A. Brealey and Stewart C. Myers, Principles of Corporate Finance (McGraw-Hill Book Company, 1996), at 204-205, 229.

69 Eugene F. Brigham, Fundamentals of Financial Management, Fifth Edition (The Dryden Press, 1989), at 623.

1 Consistent with the financial principle of risk and return discussed above,
2 increased relative risk due to small size must be considered in the allowed rate
3 of return on common equity. Therefore, the Commission's authorization of
4 a cost rate of common equity in this proceeding must appropriately reflect the
5 unique risks of the Company, including its small relative size to the Utility
6 Proxy Group, which is justified and supported above by evidence in the
7 financial literature.

8
9 Q. EARLIER YOU EXPLAINED THAT CREDIT RATINGS CAN ACT AS A PROXY FOR A
10 FIRM'S COMBINED BUSINESS AND FINANCIAL RISKS TO EQUITY OWNERS. DO
11 RATING AGENCIES ACCOUNT FOR COMPANY SIZE IN THEIR BOND RATINGS?

12 A. No. Neither S&P nor Moody's have minimum company size requirements
13 for any given rating level. This means, all else equal, a relative size analysis
14 must be conducted for equity investments in companies with similar bond
15 ratings.

16
17 Q. IS THERE A WAY TO QUANTIFY A RELATIVE RISK ADJUSTMENT DUE TO THE
18 COMPANY'S SMALL SIZE WHEN COMPARED TO THE UTILITY PROXY GROUP?

19 A. Yes. The Company has greater relative risk than the average utility in the
20 Utility Proxy Group because of its smaller size, as measured by an estimated
21 market capitalization of common equity for the Company's Minnesota
22 operations.

Table 9
Size as Measured by Market Capitalization for NSPM's
Electric Operations and the Utility Proxy Group

	Market Capitalization* (\$ Millions)	Times Greater than The Company
NSPM MN Jurisdictional	\$10,362	
Utility Proxy Group	\$14,144	1.4x
*From page 1 of Exhibit____(DWD-1), Schedule 8.		

The Company's estimated market capitalization for its Minnesota operations was \$10,362 million as of August 31, 2020, compared with the market capitalization of the average company in the Utility Proxy Group of \$14,144 million as of August 31, 2020. The average company in the Utility Proxy Group has a market capitalization 1.4 times the size of the Company's estimated Minnesota-based market capitalization.

As a result, it is necessary to upwardly adjust the indicated range of common equity cost rates attributable to the Utility Proxy Group to reflect the Company's greater risk due to their smaller relative size. The determination is based on the size premiums for portfolios of the New York Stock Exchange, American Stock Exchange, and NASDAQ listed companies ranked by deciles for the 1926 to 2019 period.⁷⁰ The average size premium for the Utility Proxy Group with a market capitalization of \$14,144 million falls in the 2nd decile, while the Company's estimated market capitalization of \$10,362 million places it in the 3rd decile. The size premium spread between the 2nd decile and the

⁷⁰ Source: Duff & Phelps Cost of Capital Navigator.

1 3rd decile is 0.23%.⁷¹ Even though a 0.23% upward size adjustment is
2 indicated, I applied a size premium of 0.05% to the Company's indicated
3 common equity cost rate in order to be conservative.

4
5 Q. SINCE THE COMPANY IS PART OF A LARGER COMPANY, WHY IS THE SIZE OF
6 XEI NOT MORE APPROPRIATE TO USE WHEN DETERMINING THE SIZE
7 ADJUSTMENT?

8 A. The return derived in this proceeding will not apply to XEI's operations as a
9 whole, but only to the Company's Minnesota operations. XEI is the sum of
10 its constituent parts, including those constituent parts' ROEs. Potential
11 investors in the Parent are aware that it is a combination of operations in each
12 state, and that each state's operations experience the operating risks specific
13 to their jurisdiction. The market's expectation of XEI's return is
14 commensurate with the realities of the Company's composite operations in
15 each of the states in which it operates.

16
17 Q. SHOULD THE COMPANY BE COMPARED WITH OTHER OPERATING ELECTRIC
18 UTILITIES IN MINNESOTA TO DETERMINE ANY ADJUSTMENT TO THE PROXY
19 GROUP-DERIVED ROE?

20 A. No, it shouldn't. Since the indicated ROE is determined using the market data
21 of the Utility Proxy Group, any type of adjustment to the indicated ROE must
22 reflect relative differences between the Company and the Utility Proxy Group.
23 Since this is the case, the relative size of other Minnesota utilities is not
24 relevant to determining the ROE for the Company.

71 *Ibid.*, See also, Exhibit__(DWD-1), Schedule 8.

1 **B. Credit Risk Adjustment**

2 Q. Please discuss your proposed credit risk adjustment.

3 A. NSPM's long-term issuer ratings are A2 and A- from Moody's Investors
4 Services and S&P, respectively, which are slightly less risky than the average
5 long-term issuer ratings for the Utility Proxy Group of A3 and BBB+,
6 respectively.⁷² Hence, a downward credit risk adjustment is necessary to
7 reflect the higher credit rating, *i.e.*, A2, of the Company relative to the A3
8 average Moody's bond rating of the Utility Proxy Group.⁷³

9
10 An indication of the magnitude of the necessary downward adjustment to
11 reflect the lower credit risk inherent in an A2 bond rating is one-third of a
12 recent three-month average spread between Moody's Baa and A-rated public
13 utility bond yields of 0.35%, shown on page 4 of Exhibit____(DWD-1),
14 Schedule 4, or 0.12%.⁷⁴

15
16 **C. Flotation Costs**

17 Q. WHAT ARE FLOTATION COSTS?

18 A. Flotation costs are those costs associated with the sale of new issuances of
19 common stock. They include market pressure and the mandatory unavoidable
20 costs of issuance (*e.g.*, underwriting fees and out-of-pocket costs for printing,
21 legal, registration, etc.). For every dollar raised through debt or equity
22 offerings, the Company receives less than one full dollar in financing.

23

72 Source of Information: S&P Global Market Intelligence.

73 As shown on page 5 of Exhibit____(DWD-1), Schedule 4.

74 $0.17\% = 0.50\% * (1/3)$. Moody's does not provide public utility bond yields for A3-rated bonds. As such, it was necessary to estimate the difference between A2-rated and A3-rated public utility bonds. Because there are three steps between Baa2 and A2 (Baa2 to Baa1, Baa1 to A3, and A3 to A2) I assumed an adjustment of one-third of the difference between the A2-rated and Baa2-rated public utility bond yield was appropriate.

1 Q. WHY IS IT IMPORTANT TO RECOGNIZE FLOTATION COSTS IN THE ALLOWED
2 COMMON EQUITY COST RATE?

3 A. It is important because there is no other mechanism in the ratemaking
4 paradigm through which such costs can be recognized and recovered.
5 Because these costs are real, necessary, and legitimate, recovery of these costs
6 should be permitted. As noted by Dr. Roger Morin:

7 The costs of issuing these securities are just as real as
8 operating and maintenance expenses or costs incurred to
9 build utility plants, and fair regulatory treatment must permit
10 recovery of these costs....

11 The simple fact of the matter is that common equity capital
12 is not free....[Flotation costs] must be recovered through a
13 rate of return adjustment.⁷⁵

14 Q. DO THE COMMON EQUITY COST RATE MODELS YOU HAVE USED ALREADY
15 REFLECT INVESTORS' ANTICIPATION OF FLOTATION COSTS?

16 A. No. All of these models assume no transaction costs. The literature is quite
17 clear that these costs are not reflected in the market prices paid for common
18 stocks. For example, Brigham and Daves confirm this and provide the
19 methodology utilized to calculate the flotation adjustment.⁷⁶ In addition,
20 Morin confirms the need for such an adjustment even when no new equity
21 issuance is imminent.⁷⁷ Consequently, it is proper to include a flotation cost
22 adjustment when using cost of common equity models to estimate the
23 common equity cost rate.

75 Morin, at p. 321.

76 Eugene F. Brigham and Phillip R. Daves, Intermediate Financial Management, 9th Edition, Thomson/Southwestern, at p. 342.

77 Morin, at pp. 327-30.

1 Q. HOW DID YOUR CALCULATE THE FLOTATION COST ALLOWANCE?

2 A. I modified the DCF calculation to provide a dividend yield that would
3 reimburse investors for issuance costs in accordance with the method cited in
4 literature by Brigham and Daves, as well as by Morin. The flotation cost
5 adjustment recognizes the actual costs of issuing equity that were incurred by
6 XEI in its equity issuances during fiscal years 2010, 2018, and 2019. Based on
7 the issuance costs shown in Schedule 21 of Ms. Sarah W. Soong's direct
8 testimony, an adjustment of 0.15% is required to reflect the flotation costs
9 applicable to the Utility Proxy Group.⁷⁸

10
11 Q. WHAT IS THE INDICATED COST OF COMMON EQUITY AFTER YOUR COMPANY-
12 SPECIFIC ADJUSTMENTS?

13 A. Applying the 0.05% size adjustment, the -0.12% credit risk adjustment, and
14 the 0.15% flotation cost adjustment to the indicated range of common equity
15 cost rates between 9.77% and 10.83% results in a Company-specific range of
16 common equity rates between 9.85% and 10.91%. In consideration of both of
17 these indicated ranges, I recommend an ROE of 10.20% for NSPM in this
18 proceeding.

19
20 **IX. CAPITAL MARKET CONDITIONS**

21
22 Q. DO ECONOMIC CONDITIONS INFLUENCE THE REQUIRED COST OF CAPITAL
23 AND REQUIRED RETURN ON COMMON EQUITY?

24 A. Yes. The models used to estimate the Cost of Equity are meant to reflect, and
25 therefore are influenced by, current and expected capital market conditions.

78 Exhibit__(DWD-1), Schedule 9.

1 Therefore, it is important to assess the reasonableness of any financial model's
2 results in the context of observable market data.

3
4 Q. PLEASE SUMMARIZE THE RECENT CAPITAL MARKET ENVIRONMENT.

5 A. It is well recognized that there have been dramatic shifts in the capital markets
6 brought about by COVID-19. The Federal Reserve and the U.S. government
7 have implemented multiple policies to address the financial market and
8 economic instability.

9
10 Although government and central bank actions have stabilized the capital
11 markets somewhat, as explained in more detail below, volatility (and,
12 therefore, risk) remains elevated for the utility sector, which has important
13 implications on the ROE.

14
15 Q. HOW DO SIGNIFICANT AND ABRUPT INCREASES IN VOLATILITY AFFECT
16 INTEREST RATES?

17 A. Significant and abrupt increases in volatility tend to be associated with declines
18 in Treasury yields. That relationship makes intuitive sense; as volatility (*i.e.*,
19 risk) increases, investors will seek to avoid a capital loss by investing in
20 Treasury securities in a "flight to safety." Because Treasury yields are inversely
21 related to Treasury bond prices, as investors bid up the prices of bonds, they
22 bid down the yields. As Chart 3 below demonstrates, decreases in the 30-year
23 Treasury yield are coincident with significant increases in the VIX.⁷⁹ In those
24 instances, the fall in yields does not reflect a reduction in required returns, it

79 The VIX is a calculation designed to produce a measure of constant, 30-day expected volatility of the U.S. stock market, derived from real-time, mid-quote prices of S&P 500 Index call and put options. Source: www.cboe.com/vix.

reflects an increase in risk aversion and, therefore, an increase in required equity returns.

Chart 3
30-Year Treasury Yields vs. VIX⁸⁰

Q. HAS MARKET VOLATILITY INCREASED IN RECENT MONTHS?

A. Yes, it has. A visible and widely reported measure of expected volatility is the VIX. Because volatility is a measure of risk, increases in the VIX, or in its volatility, are a broad indicator of expected increases in market risk. That is, if the level of the VIX was 15.00, it would be interpreted as an expected standard deviation in annual market returns of 15.00% over the coming 30 days. Since 1990, the VIX has averaged about 19.39, which is consistent with the long-term standard deviation on annual market returns as reported by Duff & Phelps.⁸¹ From February 1, 2020 to August 31, 2020, the VIX

⁸⁰ Source: Bloomberg Professional Service.

⁸¹ SBBI-2020, at 6-17.

1 averaged 33.24, or more than 71.00% above its long term average.⁸² In other
2 words, since the COVID-19 pandemic began, market volatility has been, on
3 average, 71.00% higher than the market's long-term average volatility.
4

5 Q. IS MARKET VOLATILITY EXPECTED TO REMAIN ELEVATED IN THE NEAR TERM?

6 A. Yes. One means of assessing market expectations regarding the future level
7 of volatility is to review CBOE's "Term Structure of Volatility", which is
8 described by CBOE as:

9 The implied volatility term structure observed in SPX options
10 markets is analogous to the term structure of interest rates
11 observed in fixed income markets. Similar to the calculation
12 of forward rates of interest, it is possible to observe the
13 option market's expectation of future market volatility
14 through use of the SPX implied volatility term structure.⁸³
15

16 As shown in Table 10, the implied volatility is expected to remain
17 approximately 50% above historical volatility⁸⁴ until at least December 2021.

82 Source: Bloomberg Professional Service.

83 Source: www.cboe.com/trading-tools/strategy-planning-tools/term-structure-data.

84 The long-term average price of VIX is approximately 19.00, which is similar to the long-term standard deviation of market returns.

Table 10
CBOE Term Structure of Volatility⁸⁵

Date	Projected VIX
September 2020	24.43
October 2020	27.66
November 2020	31.38
December 2020	32.29
January 2021	32.40
February 2021	31.41
March 2021	33.04
June 2021	32.88
September 2021	34.58
December 2021	30.93

As discussed above, investors reacted to the increase in market uncertainty associated with COVID-19 by moving away from equity securities (including utilities) to Treasury securities, pushing down long-term Treasury yields. Both long-term Treasury and utility bond yields have been extremely volatile, as shown on Charts 4 and 5, below, as seen in its Coefficient of Variation (CoV):⁸⁶

⁸⁵ Source: <http://www.cboe.com/trading-tools/strategy-planning-tools/term-structure-data>, as of August 31, 2020.

⁸⁶ The coefficient of variation is used by investors and economists to determine volatility.

Chart 5

6

Coefficient of Variation in A-Rated Public Utility Bonds⁸⁸

7

⁸⁷ Source: Bloomberg Professional. Data through August 31, 2020.

⁸⁸ Source: Bloomberg Professional. Data through August 31, 2020.

1 In view of all of the above, current levels of interest rates are the result of a
2 volatility-driven “flight to safety” on the part of investors, which indicates
3 increased risk aversion, and thus, an increased investor-required return.
4

5 Q. IN ADDITION TO AFFECTING TREASURY BONDS, HOW ELSE DOES INCREASED
6 MARKET VOLATILITY AFFECT A UTILITY INVESTOR’S REQUIRED RETURN?

7 A. Increased market volatility increases both utility stock volatility and those
8 stocks’ correlation to the overall market. Increases in both measures would
9 likewise increase the required return for utility investors.
10

11 Q. HAVE THE RELATIONSHIPS BETWEEN UTILITIES AND MARKET INDICES
12 CHANGED DUE TO THE CURRENT VOLATILE MARKET CONDITIONS?

13 A. Yes, they have. To determine the relationships between utilities and market
14 indices, I have calculated the correlation coefficients of the price changes of
15 several groups of utilities relative to the S&P 500 and the Dow Jones Industrial
16 Average (“DJIA”) from February 1, 2020 to August 31, 2020. Specifically, I
17 calculated correlation coefficients for the following relationships:

- 18 • The price changes of the S&P 500 relative to the price changes
19 of the Utility Proxy Group;
- 20 • The price changes of the S&P 500 relative to the price changes
21 of the Dow Jones Utility Average (“DJU”);
- 22 • The price changes of the S&P 500 relative to the price changes
23 of the Utilities Select SPDR (“XLU”);
- 24 • The price changes of the DJIA relative to the price changes of
25 Utility Proxy Group;
- 26 • The price changes of the DJIA relative to the price changes of

the DJU; and

- The price changes of the DJIA relative to the price changes of the XLU.

Table 11 provides the results of the calculations:

Table 11
Calculation of Correlation Coefficients for Utility Groups Relative to
Market Indices from February 2020 through August 2020⁸⁹

Group	S&P 500	DJIA
Utility Proxy Group	84.90%	84.08%
DJU	84.42%	83.45%
XLU	84.74%	83.39%

As shown on Table 11, utility stocks have been trading in tandem with market indices during the current market dislocation. The behavior of utility stocks to move in tandem with the market during periods of extreme volatility is not limited to the current period. During the Great Recession (December 2007 to June 2009), correlations between these same groups were similar, as shown on Table 12, below:

Table 12
Calculation of Correlation Coefficients for Utility Groups Relative to
Market Indices from December 2007 to June 2009⁹⁰

Group	S&P 500	DJIA
Utility Proxy Group	80.31%	81.56%
DJU	81.57%	82.13%
XLU	78.36%	78.59%

⁸⁹ Source: S&P Global Market Intelligence; S&P Capital IQ.

⁹⁰ Source: S&P Global Market Intelligence; S&P Capital IQ.

1 That increasing correlation is not surprising. As Morningstar recently
2 explained, during volatile markets there often is little distinction in returns
3 across assets or portfolios. That is, “correlations go to 1.”⁹¹ When that
4 happens, utility stocks lose their “defensive” quality.

5
6 Q. WHAT DO STRONGER CORRELATIONS BETWEEN UTILITY STOCKS AND THE
7 MARKET IMPLY FOR THE INVESTOR-REQUIRED RETURN?

8 A. A direct consequence of stronger correlations is higher Beta coefficients. As
9 shown in Chart 6 below, as the Coronavirus threat became apparent, the two-
10 year⁹² and five-year⁹³ correlation coefficients between the price changes in the
11 S&P 500 and price changes in the Utility Proxy Group from February 2020
12 through August 2020 increased dramatically. As shown on Chart 6, the
13 correlation coefficients increased from approximately 0.15 to approximately
14 0.70 (two-year horizon) and from approximately 0.19 to approximately 0.52
15 (five-year horizon).

91 Morningstar, *Correlations Going to 1: Amid Market Collapse, U.S. Stock Fund Factors Show Little Differentiation*, March 6, 2020.

92 Consistent with the calculation horizon of Bloomberg’s Beta coefficients.

93 Consistent with the calculation horizon of Value Line’s Beta coefficients.

Chart 6
Two-Year and Five-Year Correlation Coefficients for the Utility Proxy
Group Relative to the S&P 500⁹⁴

The increase in volatility (*i.e.*, risk), as explained above, in combination with the increased correlation between the Utility Proxy Group and market indices ultimately leads to higher Beta coefficients. In short, during a period of heightened and possibly prolonged market uncertainty, observable market information makes clear that utility investors now face greater risks and require higher returns.

X. CONCLUSION

Q. WHAT IS YOU RECOMMENDED ROE FOR THE COMPANY?

A. Given the discussion above and the results from the analyses, I recommend that an ROE of 10.20% is appropriate for the Company at this time.

⁹⁴ Source: S&P Global Market Intelligence.

1 Q. IN YOUR OPINION, IS YOUR PROPOSED ROE OF 10.20% FAIR AND
2 REASONABLE TO NSPM AND ITS CUSTOMERS?
3 A. Yes, it is.
4
5 Q. IN YOUR OPINION, IS NSPM'S PROPOSED CAPITAL STRUCTURE FAIR AND
6 REASONABLE?
7 A. Yes, it is.
8
9 Q. DOES THIS CONCLUDES YOUR DIRECT TESTIMONY?
10 A. Yes, it does.

Appendix A – Resume & Testimony Listing of:
Dylan W. D’Ascendis, CRRA, CVA
Director

Summary

Dylan is an experienced consultant and a Certified Rate of Return Analyst (CRRA) and Certified Valuation Analyst (CVA). He has served as a consultant for investor-owned and municipal utilities and authorities for 12 years. Dylan has extensive experience in rate of return analyses, class cost of service, rate design, and valuation for regulated public utilities. He has testified as an expert witness in the subjects of rate of return, cost of service, rate design, and valuation before 23 regulatory commissions in the U.S., one Canadian province, and an American Arbitration Association panel.

He also maintains the benchmark index against which the Hennessy Gas Utility Mutual Fund performance is measured.

Areas of Specialization

- | | | |

Recent Expert Testimony Submission/Apearances

<i>Jurisdiction</i>	<i>Topic</i>
■ Massachusetts Department of Public Utilities	Rate of Return
■ New Jersey Board of Public Utilities	Rate of Return
■ Hawaii Public Utilities Commission	Cost of Service, Rate Design
■ South Carolina Public Service Commission	Return on Common Equity
■ American Arbitration Association	Valuation

Recent Assignments

- Provided expert testimony on the cost of capital for ratemaking purposes before numerous state utility regulatory agencies
- Maintains the benchmark index against which the Hennessy Gas Utility Mutual Fund performance is measured
- Sponsored valuation testimony for a large municipal water company in front of an American Arbitration Association Board to justify the reasonability of their lease payments to the City
- Co-authored a valuation report on behalf of a large investor-owned utility company in response to a new state regulation which allowed the appraised value of acquired assets into rate base

Recent Publications and Speeches

- Co-Author of: “Decoupling, Risk Impacts and the Cost of Capital”, co-authored with Richard A. Michelfelder, Ph.D., Rutgers University and Pauline M. Ahern. The Electricity Journal, March, 2020.

Notes:

- (1) All capitalization and financial statistics for the group are the arithmetic average of the achieved results for each individual company in the group, and are based upon financial statements as originally reported in each year.
- (2) Computed by relating actual total debt interest or preferred stock dividends booked to average of beginning and ending total debt or preferred stock reported to be outstanding.
- (3) Total debt relative to EBITDA (Earnings before Interest, Income Taxes, Depreciation and Amortization).
- (4) Funds from operations (sum of net income, depreciation, amortization, net deferred income tax and investment tax credits, less total AFUDC) plus interest charges as a percentage of total debt.

Notes:

- (1) Indicated dividend at 08/31/2020 divided by the average closing price of the last 60 trading days ending 08/31/2020 for each company.
- (2) From pages 3 through 17 of this Schedule.
- (3) Average of columns 2 through 5 excluding negative growth rates.
- (4) This reflects a growth rate component equal to one-half the conclusion of growth rate (from column 6) x column 1 to reflect the periodic payment of dividends (Gordon Model) as opposed to the continuous payment. Thus, for ALLETE, Inc., $4.31\% \times (1 + (1/2 \times 6.30\%)) = 4.45\%$.
- (5) Column 6 + column 7.

BUSINESS: ALLETE, Inc. is the parent of Minnesota Power, which supplies electricity to 146,000 customers in northeastern MN, & Superior Water, Light & Power in northwestern WI. Electric rev. breakdown: taconite mining/processing, 26%; paper/wood products, 9%; other industrial, 8%; residential, 12%; commercial, 13%; wholesale, 16% other, 16%. ALLETE Clean Energy (ACE) owns renewable energy projects. Acq'd U.S. Water Services 2/15; sold it 3/19. Generating sources: coal & lignite, 30%; wind, 11%; other, 5%; purchased, 54%. Fuel costs: 31% of revs. '19 deprec. rate: 3.3%. Has 1,400 employees. Chairman: Alan R. Hodnik. President & CEO: Bethany M. Owen. Inc.: MN. Address: 30 West Superior St., Duluth, MN 55802-2093. Tel.: 218-279-5000. Internet: www.allete.com.																				
ALLETE's main utility subsidiary had its interim rate increase reduced. Last November, Minnesota Power filed for a \$65.9 million (10.6%) rate increase, based on a return on equity of 10.05% and a common-equity ratio of 53.81%. At the start of 2020, Minnesota Power received an interim hike of \$36.1 million (5.8%). The interim hike was reduced to \$25.5 million (4.1%), and the effective date postponed to May 1st, in response to the economic problems caused by the coronavirus situation. This will result in a \$12 million revenue refund to customers. The utility also withdrew its rate application and will not refile a case before November 1, 2021. It may file as early as March 1st under certain conditions, such as a 50-megawatt loss of load for three months. We lowered our 2020 and 2021 earnings estimates. The revenue refund will result in a charge of \$0.16 a share against second-quarter results, and having a lower interim rate hike will affect the company's earning power until Minnesota Power files its next rate case. In addition, revenues from large industrial customers will probably be lower in the last four months of 2020. (For now, there is no revenue impact because these customers put forth full power-demand nominations, before the economy worsened, through the end of August.) Putting it all together, we cut our 2020 share-net estimate by \$0.50, to \$3.05, and our 2021 expectation by \$0.30, to \$3.50. Due to the problems and increased uncertainty caused by the coronavirus, ALLETE has withdrawn its earnings guidance. Management hopes to update guidance with its second-quarter release. ALLETE Clean Energy is faring well. Its wind projects are on track, and the coronavirus has not disrupted construction. Most significantly, a 300-megawatt project is scheduled for completion by yearend at an expected cost of \$450 million. This has been one of the poorest-performing stocks in this industry in 2020. The price is down 27% in this time frame. Minnesota Power's service area has a much-larger industrial sector than most utilities, which worries investors. The dividend yield is above the industry average, and total return potential for the 18-month period is strong. Paul E. Debbas, CFA June 12, 2020

celerating planned cost-saving initiatives. Alliant has taken several steps to improve its liquidity situation. During the first quarter, it refinanced a \$300 million term loan and issued \$350 million in 30-year debentures for its Wisconsin Utility. Both deals were well received by the market at favorable interest rates. In addition, the company generated \$222 million from common equity issuance, in line with prior projections, and reiterated its plan to move forward with a \$300 million debt issuance for its Iowa utility subsidiary. At the end of March, total available liquidity, including borrowing capacity under its existing credit revolver, stood at \$1.2 billion. **This stock is now ranked 2 (Above Average) for year-ahead relative price performance, having slipped a notch on our Timeliness scale since March.** Like many utility issues, the recent quotation is well within our 2023-2025 Target Price Range, resulting in unexciting total return potential over that time frame. In addition, at 3.1%, the dividend yield doesn't stand out for a utility, further reducing the equity's investment appeal. *Daniel Henigson, CFA June 12, 2020*

				Annual Load Factor (%)				April 1, 2020. But this included the pass-through to customers of some \$115 million of lower fuel costs and \$50 million of decreased nonfuel expenses. This was a "black box" order in which an allowed ROE and common-equity ratio were not specified, but the decision was based on an implicit ROE in a range of 9.4%-9.8%.																
				% Change Customers (yr-end)				A gas rate application is pending in Illinois. Ameren filed for \$102 million, including \$46 million that would otherwise be recovered through riders (surcharges) on customers' bills. The utility requested a 10.5% ROE and a 54.1% common-equity ratio. A ruling is due by January, with new tariffs taking effect in February.																
				Fixed Charge Cov. (%)				Ameren is adding wind projects. The company is spending \$1.2 billion to add 700 megawatts of capacity. Most, if not all, of this should be in service by yearend.																
				ANNUAL RATES				The stock has outperformed most utility equities in 2020. Its price has fallen just 3%. The dividend yield is almost one percentage point below the industry average. Total return potential is average for the next 18 months, but not for the 2023-2025 period.

																BUSINESS: Edison International (formerly SCECorp) is a holding company for Southern California Edison Company (SCE), which supplies electricity to 5.1 mill. customers in a 50,000-sq.-mi. area in central, coastal, & southern CA (excl. Los Angeles & San Diego). Edison Energy is an energy svcs. co. Disc. Edison Mission Energy (independent power producer) in '12. Elec. rev. breakdown: residential, 39%; commercial, 43%; industrial, 4%; other, 14%. Generating sources: nuclear, 8%; gas, 7%; hydro, 5%; purchased, 80%. Fuel costs: 39% of revs. '19 reported depr. rate: 3.6%. Has 12,500 empl. Chairman: William P. Sullivan. Pres. & CEO: Pedro J. Pizarro, Inc.: CA. Address: 2244 Walnut Grove Ave., P.O. Box 976, Rosemead, CA 91770. Tel.: 626-302-2222. Web: www.edison.com.		
																Edison International's utility subsidiary has a general rate case pending. Southern California Edison filed for increases of \$1.109 billion (11.4%) for 2021, \$423 million for 2022, and \$514 million for 2023. The California Public Advocates proposed hikes of \$458 million in 2021, \$242 million in 2022, and \$250 million in 2023, and recommended the approval of roughly 90% of SCE's proposed capital spending. Even if an order doesn't come by yearend, any rate relief the utility receives will be retroactive to the start of 2021. Our 2020 earnings estimate is below the company's targeted range of \$4.32-\$4.62 a share for "core" earnings. Edison International's guidance excludes charges the company books for the amortization expense stemming from a fund utilities contributed to in order to address the potentially huge liabilities associated with wildfires in California. This amounted to \$60 million after taxes in the March quarter. Note that the coronavirus should have little effect on the company's income because its revenues and volume are decoupled and it should be able to defer related costs for future recovery.		
																The company has completed its financing plans for 2020. Earlier this year, the parent and SCE issued \$2.7 billion of long-term debt. Any debt the utility issues subsequently will be for refinancing. Edison International also sold \$900 million of common stock (up from \$800 million previously expected), and stated that its equity needs will be "minimal" beyond this year. Because of these significant financing moves, we estimate only a modest increase in share net next year, despite the benefit of rate relief from the aforementioned general rate case. Wildfires in California continue to be an investment concern. The company took a big reserve in the fourth quarter of 2018 and a much-smaller charge in the same period of 2019 for potential liabilities stemming from wildfire damage. Additional charges might well occur. At least the aforementioned fund should help meet costs associated with future wildfires. The stock's yield is about a percentage point above the utility average. Total return potential to 2023-2025 is modest, but above average for the group. Paul E. Debbas, CFA July 24, 2020

Business:

Portland General Electric Company (PGE) provides electricity to 899,000 customers in 52 cities in a 4,000-square-mile area of Oregon, including Portland and Salem. The company is in the process of decommissioning the Trojan nuclear plant, which it closed in 1993. Electric revenue breakdown: residential, 47%; commercial, 30%; industrial, 9%; other, 14%. Generating sources: gas, 36%; coal, 19%; wind, 8%; hydro, 6%; purchased, 31%. Fuel costs: 29% of revenues. '19 reported depreciation rate: 3.6%. Has 2,900 employees. Chairman: Jack E. Davis. President and Chief Executive Officer: Maria M. Pope. Incorporated: Oregon. Address: 121 S.W. Salmon Street, Portland, Oregon 97204. Telephone: 503-464-8000. Internet: www.portlandgeneral.com.

Portland General Electric slashed its 2020 earnings guidance upon issuing first-quarter results in late April. Not surprisingly, this was due to the effects of the weak economy and the costs of dealing with the coronavirus problem. Although PGE operates under a regulatory mechanism that decouples revenues and volume, this only partially protects the utility from the effects of the slump in kilowatt-hour sales. What's more, unlike many states, Oregon has not issued an accounting order that allows the company to defer for future recovery coronavirus-related expenses. (PGE did not report how much these costs were in the March quarter, nor did management state its expectation for the full year.) All told, the company lowered its 2020 targeted range for share profits from \$2.50-\$2.65 to \$2.20-\$2.50. The stock price has declined 24% this year, which is a larger falloff than for most utility issues. PGE's announcement prompted us to reduce our estimate from \$2.50 to \$2.30. Because any growth in 2021 will come off a lower base, we trimmed our expectation by \$0.10, to \$2.55.

The board of directors did not in-

crease the dividend in the second quarter. This is noteworthy because this is when the board usually raises the disbursement. The directors will review the dividend every quarter, but we think they will be cautious until an economic recovery is clearly under way. We don't know when this will occur, but are estimating a hike in the first quarter of 2021. PGE's target for the payout ratio is 60%-70%.

The company cut its capital budget for 2020 and 2021. The reductions were \$145 million for this year and \$30 million for next year. Some of this spending will be deferred until 2022 or later. Two key projects were still on track as of late April: a \$200 million integrated operations center and a \$160 million investment for a one-third stake in a wind project. PGE won't need to issue equity to finance its spending, but has already issued debt. More issuances are likely by yearend.

This stock has an average dividend yield, by utility standards. Total return potential is attractive for the 18-month span, but doesn't stand out for the 3- to 5-year period.

Paul E. Debbas, CFA

Xcel Energy's utilities have reached settlements on pending rate cases. The New Mexico commission approved a settlement calling for a \$31 million electric increase for Southwestern Public Service, based on a 9.45% return on equity and a 54.8% common-equity ratio. New tariffs took effect on May 28th. In Texas, SPS reached a "black box" agreement calling for an \$88 million hike without specifying an allowed ROE or common-equity ratio. A ruling from the state regulators is expected in the current quarter, with the increase retroactive to September of 2019. Public Service of Colorado, the state commission's staff, and intervenors have reached a settlement calling for a gas rate increase of \$76.9 million, based on a 9.2% ROE and a 55.6% common-equity ratio. If the regulators approve the agreement, new tariffs will be implemented on April 1, 2021, retroactive to November of 2020.

Xcel believes it can reduce expenses enough to offset the effects of the recession on kilowatt-hour sales. Cost cuts should enable operating and maintenance expenses to decline 4%-5% in 2020. Accordingly, management did not adjust its earnings guidance of \$2.73-\$2.83 a share for this year. Our estimate of \$2.75 a share is unchanged. We have also stuck with our 2021 estimate of \$2.90 a share. This would produce profit growth of 5%, which is within the company's annual goal of 5%-7%.

At least one rate case is upcoming. P.S. of Colorado plans to put forth an electric application later this summer. Northern States Power is considering filing for new electric and gas tariffs in Minnesota in November, but might well postpone its case if it can reach an agreement with the commission that compensates the utility for the decline in volume.

This high-quality stock has been one of the top performers in the electric utility industry in 2020. While the prices of most electric equities have fallen more than 10%, Xcel is almost unchanged from yearend 2019, thanks in part to its maintaining profit guidance. The dividend yield is a percentage point below the industry average, and with the recent quotation near the top of our 2023-2025 Target Price Range, total return potential is low.

Paul E. Debbas, CFA *July 24, 2020*

Notes provided on page 9 of this Schedule.

Northern States Power Company, a Minnesota Corporation
Derivation of Equity Risk Premium Based on the Total Market Approach
Using the Beta for the
Proxy Group of Fifteen Electric Companies

Notes:

- (1) Based on the arithmetic mean historical monthly returns on large company common stocks from Ibbotson® SBBI® 2020 Market Report minus the arithmetic mean monthly yield of Moody's average Aaa and Aa corporate bonds from 1926-2019.
- (2) This equity risk premium is based on a regression of the monthly equity risk premiums of large company common stocks relative to Moody's average Aaa and Aa rated corporate bond yields from 1928-2019 referenced in Note 1 above.
- (3) The Predictive Risk Premium Model (PRPM) is discussed in the accompanying direct testimony. The Ibbotson equity risk premium based on the PRPM is derived by applying the PRPM to the monthly risk premiums between Ibbotson large company common stock monthly returns and average Aaa and Aa corporate monthly bond yields, from January 1928 through August 2020.
- (4) The equity risk premium based on the Value Line Summary and Index is derived by subtracting the average consensus forecast of Aaa corporate bonds of 2.98% (from page 3 of this Schedule) from the projected 3-5 year total annual market return of 14.45% (described fully in note 1 on page 2 of Exhibit__(DWD-1), Schedule 5).
- (5) Using data from Value Line for the S&P 500, an expected total return of 13.83% was derived based upon expected dividend yields and long-term earnings growth estimates as a proxy for capital appreciation. Subtracting the average consensus forecast of Aaa corporate bonds of 2.98% results in an expected equity risk premium of 10.85%.
- (6) Using data from the Bloomberg Professional Service for the S&P 500, an expected total return of 13.78% was derived based upon expected dividend yields and long-term earnings growth estimates as a proxy for capital appreciation. Subtracting the average consensus forecast of Aaa corporate bonds of 2.98% results in an expected equity risk premium of 10.80%.
- (7) Average of mean and median beta from Exhibit__(DWD-1), Schedule 5.

Forecasts for interest rates and the Federal Reserve's Major Currency Index represent averages for the quarter. Forecasts for Real GDP, GDP Price Index and Consumer Price Index are seasonally-adjusted annual rates of change (saar). Individual panel members' forecasts are on pages 4 through 9. Historical data: Treasury rates from the Federal Reserve Board's H.15; AAA-AA and A-BBB corporate bond yields from Bank of America-Merrill Lynch and are 15+ years, yield to maturity; State and local bond yields from Bank of America-Merrill Lynch, A-rated, yield to maturity; Mortgage rates from Freddie Mac, 30-year, fixed; LIBOR quotes from Intercontinental Exchange. All interest rate data are sourced from Haver Analytics. Historical data for Fed's Major Currency Index are from FRSR H.10. Historical data for Real GDP and GDP Chained Price Index are from the Bureau of Economic Analysis (BEA). Consumer Price Index (CPI) history is from the Department of Labor's Bureau of Labor Statistics (BLS).

Long-Range Survey:

The table below contains the results of our twice-annual long-range CONSENSUS survey. There are also Top 10 and Bottom 10 averages for each variable. Shown are consensus estimates for the years 2021 through 2026 and averages for the five-year periods 2022-2026 and 2027-2031. Apply these projections cautiously. Few if any economic, demographic and political forces can be evaluated accurately over such long time spans.

		Average For The Year						Five-Year Averages	
		2021	2022	2023	2024	2025	2026	2022-2026	2027-2031

Northern States Power Company, a Minnesota Corporation
Derivation of Mean Equity Risk Premium Based Studies
Using Holding Period Returns and
Projected Market Appreciation of the S&P Utility Index

<u>Line No.</u>		<u>Implied Equity Risk Premium</u>
	<u>Equity Risk Premium based on S&P Utility Index Holding Period Returns (1):</u>	
1.	Historical Equity Risk Premium	4.21 %
2.	Regression of Historical Equity Risk Premium (2)	6.83
3.	Forecasted Equity Risk Premium Based on PRPM (3)	5.53
4.	Forecasted Equity Risk Premium based on Projected Total Return on the S&P Utilities Index (Value Line Data) (4)	6.80
5.	Forecasted Equity Risk Premium based on Projected Total Return on the S&P Utilities Index (Bloomberg Data) (5)	<u>7.89</u>
6.	Average Equity Risk Premium (6)	<u><u>6.25 %</u></u>

- Notes: (1) Based on S&P Public Utility Index monthly total returns and Moody's Public Utility Bond average monthly yields from 1928-2019. Holding period returns are calculated based upon income received (dividends and interest) plus the relative change in the market value of a security over a one-year holding period.
- (2) This equity risk premium is based on a regression of the monthly equity risk premiums of the S&P Utility Index relative to Moody's A rated public utility bond yields from 1928 - 2019 referenced in note 1 above.
- (3) The Predictive Risk Premium Model (PRPM) is applied to the risk premium of the monthly total returns of the S&P Utility Index and the monthly yields on Moody's A rated public utility bonds from January 1928 - August 2020.
- (4) Using data from Value Line for the S&P Utilities Index, an expected return of 10.36% was derived based on expected dividend yields and long-term growth estimates as a proxy for market appreciation. Subtracting the expected A rated public utility bond yield of 3.56%, calculated on line 3 of page 3 of this Schedule results in an equity risk premium of 6.80%. (10.36% - 3.56% = 6.80%)
- (5) Using data from Bloomberg Professional Service for the S&P Utilities Index, an expected return of 11.45% was derived based on expected dividend yields and long-term growth estimates as a proxy for market appreciation. Subtracting the expected A rated public utility bond yield of 3.56%, calculated on line 3 of page 3 of this Schedule results in an equity risk premium of 7.89%. (11.45% - 3.56% = 7.89%)
- (6) Average of lines 1 through 5.

Notes on page 2 of this Schedule.

Northern States Power Company, a Minnesota Corporation
Notes to Accompany the Application of the CAPM and ECAPM

Notes:

- (1) The market risk premium (MRP) is derived by using six different measures from three sources: Ibbotson, Value Line, and Bloomberg as illustrated below:

Historical Data MRP Estimates:

Measure 1: Ibbotson Arithmetic Mean MRP (1926-2019)

Arithmetic Mean Monthly Returns for Large Stocks 1926-2019:	12.10 %
Arithmetic Mean Income Returns on Long-Term Government Bonds:	5.09
MRP based on Ibbotson Historical Data:	<u>7.01 %</u>

Measure 2: Application of a Regression Analysis to Ibbotson Historical Data (1926-2019)

10.24 %

Measure 3: Application of the PRPM to Ibbotson Historical Data: (January 1926 - August 2020)

10.73 %

Value Line MRP Estimates:

Measure 4: Value Line Projected MRP (Thirteen weeks ending September 04, 2020)

Total projected return on the market 3-5 years hence*:	14.45 %
Projected Risk-Free Rate (see note 2):	2.05
MRP based on Value Line Summary & Index:	<u>12.40 %</u>
*Forecasted 3-5 year capital appreciation plus expected dividend yield	

Measure 5: Value Line Projected Return on the Market based on the S&P 500

Total return on the Market based on the S&P 500:	13.83 %
Projected Risk-Free Rate (see note 2):	2.05
MRP based on Value Line data	<u>11.78 %</u>

Measure 6: Bloomberg Projected MRP

Total return on the Market based on the S&P 500:	13.78 %
Projected Risk-Free Rate (see note 2):	2.05
MRP based on Bloomberg data	<u>11.73 %</u>

Average of Value Line, Ibbotson, and Bloomberg MRP: 10.65 %

- (2) For reasons explained in the direct testimony, the appropriate risk-free rate for cost of capital purposes is the average forecast of 30 year Treasury Bonds per the consensus of nearly 50 economists reported in Blue Chip Financial Forecasts. (See pages 10-11 of Exhibit (DWD-1) Schedule 4.) The projection of the risk-free rate is illustrated below:

Third Quarter 2020	1.40 %
Fourth Quarter 2020	1.50
First Quarter 2021	1.60
Second Quarter 2021	1.60
Third Quarter 2021	1.70
Fourth Quarter 2021	1.80
2022-2026	3.00
2027-2031	3.80
	<u>2.05 %</u>

- (3) Average of Column 6 and Column 7.

Bloomberg Professional Services

Northern States Power Company, a Minnesota Corporation
Basis of Selection of the Group of Non-Price Regulated Companies
Comparable in Total Risk to the Utility Proxy Group

The criteria for selection of the Non-Price Regulated Proxy Group was that the non-price regulated companies be domestic and reported in Value Line Investment Survey (Standard Edition).

The Non-Price Regulated Proxy Group companies were then selected based on the unadjusted beta range of 0.64 – 0.92 and residual standard error of the regression range of 2.5047 – 2.9871 of the Utility Proxy Group.

These ranges are based upon plus or minus two standard deviations of the unadjusted beta and standard error of the regression. Plus or minus two standard deviations captures 95.50% of the distribution of unadjusted betas and residual standard errors of the regression.

The standard deviation of the Gas Utility Proxy Group's residual standard error of the regression is 0.1206. The standard deviation of the standard error of the regression is calculated as follows:

$$\text{Standard Deviation of the Std. Err. of the Regr.} = \frac{\text{Standard Error of the Regression}}{\sqrt{2N}}$$

where: N = number of observations. Since Value Line betas are derived from weekly price change observations over a period of five years, N = 259

$$\text{Thus, } 0.1206 = \frac{2.7459}{\sqrt{518}} = \frac{2.7459}{22.7596}$$

- (1) The application of the DCF model to the domestic, non-price regulated comparable risk companies is identical to the application of the DCF to the Utility Proxy Group. The dividend yield is derived by using the 60 day average price and the spot indicated dividend as of August 31, 2020. The dividend yield is then adjusted by 1/2 the average projected growth rate in EPS, which is calculated by averaging the 5 year projected growth in EPS provided by Value Line, www.zacks.com, Bloomberg Professional Services, and www.yahoo.com (excluding any negative growth rates) and then adding that growth rate to the adjusted dividend yield.

- (1) The application of the DCF model to the domestic, non-price regulated comparable risk companies is identical to the application of the DCF to the Utility Proxy Group. The dividend yield is derived by using the 60 day average price and the spot indicated dividend as of August 31, 2020. The dividend yield is then adjusted by 1/2 the average projected growth rate in EPS, which is calculated by averaging the 5 year projected growth in EPS provided by Value Line, www.zacks.com, Bloomberg Professional Services, and www.yahoo.com (excluding any negative growth rates) and then adding that growth rate to the adjusted dividend yield.
- (2) The Two Growth Method was applied to Companies with short-term EPS growth rates greater than one standard deviation from the overall non-price regulated comparable risk companies' mean growth rate. The mean of all non-price regulated comparable risk companies with growth rates are within one standard deviation of the overall mean growth rate was applied as the long-term growth rate for these Companies.

Northern States Power Company, a Minnesota Corporation
Indicated Common Equity Cost Rate
Through Use of a Risk Premium Model
Using an Adjusted Total Market Approach

<u>Line No.</u>		<u>Proxy Group of Forty- Seven Non-Price Regulated Companies</u>
1.	Prospective Yield on Baa Rated Corporate Bonds (1)	4.10 %
2.	Adjustment to Reflect Proxy Group Bond Rating (2)	<u>(0.20)</u>
3.	Prospective Bond Rating	3.90
4.	Equity Risk Premium (3)	<u>8.78</u>
5	Risk Premium Derived Common Equity Cost Rate	<u><u>12.68 %</u></u>

Notes: (1) Average forecast of Baa corporate bonds based upon the consensus of nearly 50 economists reported in Blue Chip Financial Forecasts dated June 1, 2020 and September 1, 2020 (see pages 10-11 of Exhibit__(DWD-1) Schedule 4). The estimates are detailed below.

Third Quarter 2020	3.50 %
Fourth Quarter 2020	3.60
First Quarter 2021	3.70
Second Quarter 2021	3.70
Third Quarter 2021	3.80
Fourth Quarter 2021	3.80
2022-2026	5.00
2027-2031	<u>5.70</u>
Average	<u><u>4.10 %</u></u>

(2) To reflect the Baa1 average rating of the non-utility proxy group, the prospective yield on Baa corporate bonds must be adjusted downward by 1/3 of the spread between A and Baa corporate bond yields as shown below:

	A Corp. Bond Yield		Baa Corp. Bond Yield		Spread
Aug-2020	2.68 %		3.27 %		0.59 %
Jul-2020	2.69		3.31		0.62
Jun-2020	3.02		3.65		<u>0.63</u>
	Average yield spread				<u><u>0.61 %</u></u>
			1/3 of spread		<u><u>0.20 %</u></u>

			*From 2020 Duff & Phelps Cost of Capital Navigator					

Notes:

- (1) From page 2 of this Schedule.
- (2) Gleaned from Columns [B] and [C] on the bottom of this page. The appropriate decile (Column [A]) corresponds to the market capitalization of the proxy group, which is found in Column [1].
- (3) Corresponding risk premium to the decile is provided in Column [D] on the bottom of this page.
- (4) Line No. 1 Column [3] – Line No. 2 Column [3]. For example, the 0.23% in Column [4], Line No. 2 is derived as follows 0.23% = 0.73% - 0.50%.
