Our Energy Information Systems program offers a holistic approach to managing commercial and industrial energy use through vital energy information system equipment. By improving energy performance through the use of your energy information system, you can increase cost savings, improve productivity and reduce operational costs over the long term.

Benefits of our Energy Information Systems program
• Free coaching to ensure you’re set up with the most effective energy-efficient energy information system within your budget.
• On-site assessment and energy management consulting throughout the three phases and beyond.
• Sophisticated energy analysis and visualization capabilities to help you gain deeper energy efficiency savings.
• Tools to identify and track your energy related carbon footprint and sustainability efforts of your energy information system.
• System improvement incentive — with a potential to cover 30% of your installation costs.

How it works
• Once our signed agreement is reached, we provide consulting on how your energy information system can achieve your energy efficiency and cost savings goals.
• A kick-off roundtable discovery meeting is held with our consultants and your energy team to define roles and responsibilities and define your energy champion representative.
• We begin the three-step process:

  **Phase 1 – SETUP**
  Once our customer agreement is in place, we’ll conduct a kick-off discovery meeting with your energy team and our consultants to define roles and responsibilities and identify your energy champion representative. Next steps include:
  • Defining your energy information system baseline model, metering plan, and measurement and verification plan for the facility.
  • Conducting an on-site Energy Management Assessment (EMA) with Xcel Energy consultants.
  • Identifying energy information system software that aligns with your needs and program requirements.

  **Phase 2 – TREATMENT**
  Xcel Energy continues to provide these no-cost consultative services during the process:
  • Conducting a one- to three-day, on-site energy scan with Xcel Energy consultants.
  • Identifying energy savings opportunities -- from behavioral to lost-cost-operations and maintenance measures.
  • Reviewing high-level summary of capital projects with rebate opportunities.
  • Providing ongoing support based on your needs.

  **Phase 3 – VERIFICATION**
  During the third phase, a data analysis is performed utilizing the energy information system. We will provide an annual measurement and verification plan report that summarizes:
  • Savings attributed to upgrades made with Xcel Energy custom and prescriptive rebates
  • Savings attributed to behavioral and low-cost operations and maintenance measures

ELIGIBILITY REQUIREMENTS
• A large commercial or industrial customer within Xcel Energy’s Minnesota service territory.
• You will have installed an energy information system that meets program requirements.
• You’re not participating in our Commercial Efficiency or Process Efficiency programs.
• You agree to a three-year commitment with a focus on your energy information system.
• You’re committed to achieving behavioral savings

HOW TO GET STARTED
