

Remote PC Power Management

Remotely power down your PCs when they are not in use to save energy

Adding PC power management can significantly reduce power consumption, while providing a broad range of performance and IT advantages. When you install PC management software you may qualify for money-saving rebates.

One of the biggest challenges IT operations professionals face is managing an increasingly distributed and diverse client environment. Client management suite technology can help by automating software distribution, patches and general systems management.

How can PC power management create savings?

The top motivation for pursuing greener IT is to reduce the energy-related operating expenses of electric use from computers. PC power management can do this very effectively by powering down PCs during periods of inactivity. The average desktop PC wastes half of the energy it consumes. ENERGY STAR[®] estimates that businesses can save \$25 to \$75 per PC per year.*

Take advantage of rebates when you install PC power management software

You can earn a rebate of \$5 per PC when you install qualifying PC power management software. To qualify, your PC Power Management software must be new, and your business must be an electric business customer in Minnesota, Colorado or New Mexico. Visit xcelenergy.com/ComputerEfficiency for the Computer Efficiency program application and complete rebate details.

Reduce costs without capital expenditure

While more energy-efficient computer equipment is a reliable way to reduce energy costs and environmental impact, they require capital investment. PC power management is an effective cost-saving solution with very little investment. There are a variety of tools to assist in implementing power management.

Address your most energy-consuming environment

What consumes more energy: your data center or the IT assets outside of your data center? IT professionals report that more electricity is used outside the data center by a margin of 10 percent. While every organization is different, your energy reduction efforts in the PC environment might offer a larger payoff than in your data center.
